

# UBSC/ULSC – 60<sup>+</sup>GHz Ultra Broadband Silicon Capacitors – Surface Mounted

Rev 2.5

## Key Features

- Ultra broadband performance up to 60<sup>+</sup>GHz
  - Resonance free
  - Phase stability
  - Ultra high stability of capacitance value over:
    - Temperature <  $\pm 0.5$  % (-55°C to +150°C)
    - Voltage < 0.1 %/V
    - Aging < 0.001 %/1000 hours
  - Low ESL
  - High reliability (FIT < 0.017 parts/billion hours)
  - Compatible with lead free reflow-soldering\*
- \* Please refer to our Assembly Application Note for more details

## Key Applications

- Optoelectronics/high-speed data
- Trans-Impedance Amplifiers (TIA)
- Receive-and-Transmit Optical Sub-Assembly (ROSA/TOSA)
- Synchronous Optical Networking (SONET)
- High speed digital logic
- Broadband test equipment
- Broadband microwave/millimeter wave
- Replacement of X7R and NP0
- Low profile applications (400 or 100  $\mu$ m)

UBSC/ULSC Capacitors target **optical communication systems** (ROSA/TOSA, SONET and all optoelectronics) as well as **high speed data systems** or products. The UBSC/ULSC are designed for DC blocking, feedback, coupling and bypass grounding applications. The unique technology of integrated passive devices in silicon developed by IPDiA, offers **low insertion loss, low reflection and high phase stability** from 16 kHz up to 60 GHz for the UBSC and up to 20 GHz for the ULSC. These deep trench silicon capacitors have been developed with a semiconductor MOS process.

The UBSC / ULSC capacitors provide **very high reliability** and capacitance stability over temperature ( $\pm 0.5$  %) and voltage. They have an extended operating temperature range from -55 to 150°C. **Reliable and repeatable performances** are obtained thanks to a fully controlled production line with high temperature curing (above 900°C) generating a highly pure oxide. The UBSC / ULSC series are compliant with standard JEDEC assembly rules, making the product fully compatible with high speed automated pick-and-place manufacturing operations. Case sizes of 0201 and 0603 are also available. These capacitors are RoHS-compliant and are available with ENIG terminations.

## Electrical Specifications

| Part number     | Product description  | Case Size | Thickness |
|-----------------|--|-----------|-----------|
| <b>UBSC.xxx</b> | Surface Mount Ultra Broad Band Silicon Capacitor from -55 to 150°C, 60+GHz with ENIG termination |           |           |
| 935 151 423 510 | Ultra Broadband Si Cap 10nF 60+GHz 400µm, BV>11V   | 0201      | 400µm     |

## Termination and Outline

### Termination

Lead-free nickel/solder coating compatible with automatic soldering technologies: reflow and manual.

### Package Outline

For landing pad dimensions on your PCB layout, please refer to IPDiA assembly application note.

| (mm) | Pad dimensions |      |      | Case size (typ. ±0.01mm) |      |   |
|------|----------------|------|------|--------------------------|------|---|
|      | a              | b    | c    | L                        | W    | T   |
| 0201 | 0.15           | 0.40 | 0.30 | 0.80                     | 0.60 | 0.40 (standard profile) or 0.10 (low profile) |
| 0402 | 0.30           | 0.50 | 0.40 | 1.20                     | 0.70 |   |
| 0603 | 0.40           | 0.90 | 0.80 | 1.80                     | 1.10 |   |

## Packaging

Tape and reel, waffle pack, film frame carrier or raw wafer delivery.

## Introduction

This document describes the attachment techniques recommended by IPDiA for their UBSC/ULSCC (100µm thickness) silicon capacitors on the customer substrates. This document is non-exhaustive. Customers with specific attachment requirements or attachment scenarios that are not covered by this document should contact IPDiA. The solder printing is described in this document but other processes like solder jetting, capacitors pre-bumped, ... can also be used with the same recommendations.

IPDiA Silicon capacitor  
(1206)

The silicon capacitor  
mounted on PCB board

## Handling precautions and storage

Silicon die must always be handled in a clean room environment (usually class 1000 (ISO 6)) but the assembled devices don't need to be handled in such an environment as the product is already well packed. The remaining quantities have to be repacked immediately after any process step, in the same conditions as before the opening (ESD bag + N2)

Store the capacitors in the manufacturer's package in the following conditions without a rapid thermal change in an indoor room:

- Temperature: -10 to 40 degree C
- Humidity: 30 to 70%RH

Avoid storing the capacitors in the following conditions:

- (a) Ambient air containing corrosive gas. (Chlorine, Hydrogen sulfide, Ammonia, Sulfuric acid, Nitric oxide, etc.)
- (b) Ambient air containing volatile or combustible gas
- (c) In environments with a high concentration of airborne particles
- (d) In liquid (water, oil, chemical solution, organic solvents, etc.)
- (e) In direct sunlight
- (f) In freezing environments

To avoid contamination and damage like scratches and cracks, our recommendations are:

- Die must never be handled with bare hands
- Avoid touching the active face
- Do not store and transport die outside protective bags, tubes, boxes, sawn tape
- Work only in ESD environments
- Plastic tweezers or a soft vacuum tool are recommended to remove the silicon die from the packing.

Standard packing is tape & reel for die size larger than 0201 but silicon capacitors can be provided within waffle pack, gelpak or sawing frame. Please contact the IPDIA sales contact for drawing and references ([sales@ipdia.com](mailto:sales@ipdia.com)).

**Pad opening**

The top surface of the IPDiA silicon capacitors are protected with a mineral passivation. The finishing of the contact pads are in nickel gold (generally 5µm nickel and 0.2µm gold) conforming with the soldering process.

IPDiA recommends having an opening on the board which matches the pad of the capacitor (size, position and spacing) – see figure 1. On the substrate, the metal layer can be larger than the varnish coating opening size but in this case, the varnish coating opening has to be mirror with the pad size of the capacitor. These recommendations will improve the die placement, tilting and will avoid the contact between the solder paste and the bare silicon die (see figure 2).

Solder paste after reflow:

Figure 1: Solder paste after reflow - Targeted

Figure 2: Solder paste after reflow - Rejected

Design of the board:

Figure 3: Opening of the metal layer on the customer substrate should match the pad of the silicon die

On the customer substrate, IPDiA recommends SMD (Solder Mask Design) to control the solder flowing on the tracks:

Landing pad for the PCB and die pad dimensions for the IPDiA silicon die:

| Silicon Capacitor Type | Capacitor size (µm <sup>2</sup> ) | Capacitor thickness | A (µm) | B (µm) | C (µm) |
|------------------------|-----------------------------------|---------------------|--------|--------|--------|
| 0201                   | 800 x 600                         | 100µm               | 150    | 400    | 300    |
| 0402                   | 1200 x 700                        |                     | 300    | 500    | 400    |
| 0603                   | 1800 x 1100                       |                     | 400    | 900    | 800    |
| 0805                   | 2200 x 1400                       |                     | 500    | 1200   | 1000   |
| 1206                   | 3400 x 1800                       |                     | 600    | 1600   | 2000   |
| 1812                   | 4700 x 3600                       |                     | 900    | 3400   | 2700   |

Process Flow

Solder print material and stencil printing recommendations

Solder pastes SnPb63/37 or SAC305 are usually used and recommended but other materials compatible with the die pad finishing are also possible. In function of the die pad size, powder size could be adjusted.

| ALLOY  | COMPOSITION        | SOLIDUS | LIQUIDUS | COMMENTS |
|--------|--------------------|---------|----------|----------|
| Sn63   | 63Sn, 37Pb         | 183°C   | 183°C    | Eutectic |
| SAC305 | 96,5Sn, 3Ag, 0.5Cu | 217°C   | 217°C    | Eutectic |

Water soluble and no clean flux can be used. In case of water soluble flux, remove the flux immediately after reflow to avoid the potential issue of leakage current between pads.

**Stencil design rules in function of the quality :**

INOX LASER:  $[(L*W)/(2*(L+W)*T)] > 0.66$  &  $W > 1.5*T$

NICKEL LASER:  $[(L*W)/(2*(L+W)*T)] > 0.53$  &  $W > 1.2*T$

ELECTROFORMED:  $[(L*W)/(2*(L+W)*T)] > 0.44$  &  $W > 1.0*T$

And in all cases :  $W > 5 * \text{powder size}$

A solder joint thickness of 40µm +/-10 is targeted to limit the risk of contact between the solder paste and the side of the capacitor. Such a contact would have a negative effect and would probably create a high leakage or a short circuit. Limited solder joint thickness will also avoid an excessive tilting of the capacitor.

For example, design of stencils done by IPDiA (SAC305 type 6 with 50% of flux):

| Silicon Capacitor Type | Stencil opening size<br>µm <sup>2</sup> | Stencil thickness<br>µm | Stencil quality |
|------------------------|---|-------------------------|-----------------|
| <b>0201</b>            | 150 x 320                               | 100                     | ELECTROFORMED   |
| <b>0402</b>            | 260 x 369                               | 125                     | NICKEL LASER    |
| <b>0603</b>            | 300 x 768                               | 125                     | NICKEL LASER    |
| <b>0805</b>            | 400 x 960                               | 125                     | NICKEL LASER    |
| <b>1206</b>            | 500 x 1229                              | 125                     | NICKEL LASER    |
| <b>1812</b>            | 700 x 2798                              | 125                     | NICKEL LASER    |

Procedure for the solder joint measurement (After reflow):

STEP 1:

STEP 2:

## Pick and Place

The most common approach is with automatic equipment using vision assist to correct placement after picking but manual placement can also be done.

Using a rubber tip is particularly preferred for the die manipulation.

A minimum pressure of 50 grams and a maximum of 150 grams is recommended for the die placement on the solder paste.

## Reflow soldering

IPDiA recommends convection reflow but vapor phase reflow and infrared reflow could be also used.

The reflow has to be done conforming with the standard JEDEC.

Figure 4: Generic reflow profile according to JEDEC J-STD-020-C

| PROFILE FEATURE                   | SnPb 63/37        | SAC305 (Lead-Free Assembly) |
|-----------------------------------|-------------------|-----------------------------|
| <b>Preheat/soak</b>               |                   |                             |
| Temperature min (Ts min)          | 100°C             | 150°C                       |
| Temperature max (Ts max)          | 150°C             | 200°C                       |
| Time (ts) from (Ts min to Ts max) | 60 to 120s        | 60 to 120s                  |
| <b>Ramp-up</b>                    |                   |                             |
| Ramp-up rate (tL to tp)           | 3°C/s maximum     | 3°C/s maximum               |
| Liquidus temperature(TL)          | 183°C             | 217°C                       |
| Time (tL) maintained above TL     | 60s to 150s       | 60s to 150s                 |
| Peak temperature (Tp)             | 220°C             | 260°C                       |
| Time 25°C to peak temperature     | 6 minutes maximum | 8 minutes maximum           |
| <b>Ramp-down</b>                  |                   |                             |
| Ramp-down rate (Tp to TL)         | 6°C/s maximum     | 6°C/s maximum               |

Flux removes tarnish films, maintains surface cleanliness and facilitates solder spread during attachment operations. The flux must be compatible with the soldering temperature and soldering times. In case of water soluble flux, please refer to the solder paste supplier for the cleaning and flux removal. Flux residues could be responsible for current leakage or short circuits. For optimum results, clean the circuits immediately after reflow.

mounted on PCB board

## Handling precautions and storage

Silicon die must always be handled in a clean room environment (usually class 1000 (ISO 6)) but the assembled devices don't need to be handled in such an environment as the product is already well packed. The remaining quantities have to be repacked immediately after any process step, in the same conditions as before the opening (ESD bag + N2)

Store the capacitors in the manufacturer's package in the following conditions without a rapid thermal change in an indoor room:

- Temperature: -10 to 40 degree C
- Humidity: 30 to 70%RH

Avoid storing the capacitors in the following conditions:

- (a) Ambient air containing corrosive gas. (Chlorine, Hydrogen sulfide, Ammonia, Sulfuric acid, Nitric oxide, etc.)
- (b) Ambient air containing volatile or combustible gas
- (c) In environments with a high concentration of airborne particles
- (d) In liquid (water, oil, chemical solution, organic solvents, etc.)
- (e) In direct sunlight
- (f) In freezing environments

To avoid contamination and damage like scratches and cracks, our recommendations are:

- Die must never be handled with bare hands
- Avoid touching the active face
- Do not store and transport die outside protective bags, tubes, boxes, sawn tape
- Work only in ESD environments
- Plastic tweezers or a soft vacuum tool are recommended to remove the silicon die from the packing.

Standard packing is tape & reel for die size larger than 0201 but silicon capacitors can be provided within waffle pack, gelpak or sawing frame. Please contact the IPDIA sales contact for drawing and references ([sales@ipdia.com](mailto:sales@ipdia.com)).

**Pad opening**

The top surface of the IPDiA silicon capacitors are protected with a mineral passivation. The finishing of the contact pads are in nickel gold (generally 5µm nickel and 0.2µm gold) conforming with the soldering process.

IPDiA recommends having an opening on the board which matches the pad of the capacitor (size, position and spacing) – see figure 1. On the substrate, the metal layer can be larger than the varnish coating opening size but in this case, the varnish coating opening has to be mirror with the pad size of the capacitor. These recommendations will improve the die placement, tilting and will avoid the contact between the solder paste and the bare silicon die (see figure 2).

Solder paste after reflow:

Figure 1: Solder paste after reflow - Targeted

Figure 2: Solder paste after reflow - Rejected

Design of the board:

Figure 3: Opening of the metal layer on the customer substrate should match the pad of the silicon die

On the customer substrate, IPDiA recommends SMD (Solder Mask Design) to control the solder flowing on the tracks:

Landing pad for the PCB and die pad dimensions for the IPDiA silicon die:

| Silicon Capacitor Type | Capacitor size (µm <sup>2</sup> ) | Capacitor thickness | A (µm) | B (µm) | C (µm) |
|------------------------|-----------------------------------|---------------------|--------|--------|--------|
| 0201                   | 800 x 600                         | 400µm               | 150    | 400    | 300    |
| 0402                   | 1200 x 700                        |                     | 300    | 500    | 400    |

Process Flow

1- Solder printing of the substrate

2- Picking of the silicon die and placement

3- Reflowing

4- Cleaning

Solder print material and stencil printing recommendations

Solder pastes SnPb63/37 or SAC305 are usually used and recommended but other materials compatible with the die pad finishing are also possible. In function of the die pad size, powder size could be adjusted.

| ALLOY  | COMPOSITION        | SOLIDUS | LIQUIDUS | COMMENTS |
|--------|--------------------|---------|----------|----------|
| Sn63   | 63Sn, 37Pb         | 183°C   | 183°C    | Eutectic |
| SAC305 | 96,5Sn, 3Ag, 0.5Cu | 217°C   | 217°C    | Eutectic |

Water soluble and no clean flux can be used. In case of water soluble flux, remove the flux immediately after reflow to avoid the potential issue of leakage current between pads.

**Stencil design rules in function of the quality :**

INOX LASER:  $[(L*W)/(2*(L+W)*T)] > 0.66$  &  $W > 1.5*T$

NICKEL LASER:  $[(L*W)/(2*(L+W)*T)] > 0.53$  &  $W > 1.2*T$

ELECTROFORMED:  $[(L*W)/(2*(L+W)*T)] > 0.44$  &  $W > 1.0*T$

And in all cases :  $W > 5 * \text{powder size}$

A solder joint thickness of 40µm +/-10 is targeted to limit the risk of contact between the solder paste and the side of the capacitor. Such a contact would have a negative effect and would probably create a high leakage or a short circuit. Limited solder joint thickness will also avoid an excessive tilting of the capacitor.

For example, design of stencils done by IPDiA (SAC305 type 6 with 50% of flux):

| Silicon Capacitor Type | Stencil opening size<br>µm <sup>2</sup> | Stencil thickness<br>µm | Stencil quality |
|------------------------|---|-------------------------|-----------------|
| <b>0201</b>            | 150 x 320                               | 100                     | ELECTROFORMED   |
| <b>0402</b>            | 260 x 369                               | 125                     | NICKEL LASER    |
| <b>0603</b>            | 300 x 768                               | 125                     | NICKEL LASER    |
| <b>0805</b>            | 400 x 960                               | 125                     | NICKEL LASER    |
| <b>1206</b>            | 500 x 1229                              | 125                     | NICKEL LASER    |
| <b>1812</b>            | 700 x 2798                              | 125                     | NICKEL LASER    |

Procedure for the solder joint measurement (After reflow):

STEP 1:

STEP 2:

## Pick and Place

The most common approach is with automatic equipment using vision assist to correct placement after picking but manual placement can also be done.

Using a rubber tip is particularly preferred for the die manipulation.

A minimum pressure of 50 grams and a maximum of 150 grams is recommended for the die placement on the solder paste.

## Reflow soldering

IPDiA recommends convection reflow but vapor phase reflow and infrared reflow could be also used.

The reflow has to be done conforming with the standard JEDEC.

Figure 4: Generic reflow profile according to JEDEC J-STD-020-C

| PROFILE FEATURE                   | SnPb 63/37        | SAC305 (Lead-Free Assembly) |
|-----------------------------------|-------------------|-----------------------------|
| <b>Preheat/soak</b>               |                   |                             |
| Temperature min (Ts min)          | 100°C             | 150°C                       |
| Temperature max (Ts max)          | 150°C             | 200°C                       |
| Time (ts) from (Ts min to Ts max) | 60 to 120s        | 60 to 120s                  |
| <b>Ramp-up</b>                    |                   |                             |
| Ramp-up rate (TL to tp)           | 3°C/s maximum     | 3°C/s maximum               |
| Liquidus temperature(TL)          | 183°C             | 217°C                       |
| Time (tL) maintained above TL     | 60s to 150s       | 60s to 150s                 |
| Peak temperature (Tp)             | 220°C             | 260°C                       |
| Time 25°C to peak temperature     | 6 minutes maximum | 8 minutes maximum           |
| <b>Ramp-down</b>                  |                   |                             |
| Ramp-down rate (Tp to TL)         | 6°C/s maximum     | 6°C/s maximum               |

Flux removes tarnish films, maintains surface cleanliness and facilitates solder spread during attachment operations. The flux must be compatible with the soldering temperature and soldering times. In case of water soluble flux, please refer to the solder paste supplier for the cleaning and flux removal. Flux residues could be responsible for current leakage or short circuits. For optimum results, clean the circuits immediately after reflow.

## Revision
