

Sup/IRBuck™

USER GUIDE FOR IR3839 EVALUATION BOARD

DESCRIPTION

The IR3839 *SupIRBuck™* is an easy-to-use, fully integrated and highly efficient DC/DC regulator. The onboard PWM controller and MOSFETs make IR3839 a space-efficient solution, providing accurate power delivery for low output voltage applications.

IR3839 is a versatile regulator which offers programmability of switching frequency and current limit while operates in wide input and output voltage range.

The switching frequency is programmable from 250kHz to 1.5MHz for an optimum solution.

Key features includes: Internal LDO, Pre-Bias startup, protection functions, such as hiccup current limit and thermal shutdown to give required system level security in the event of fault conditions. An output over-current protection function is implemented by sensing the voltage developed across the on-resistance of the synchronous rectifier MOSFET for optimum cost and performance.

This user guide contains the schematic and bill of materials for the IR3839 evaluation board. The guide describes operation and use of the evaluation board itself. Detailed application information for IR3839 is available in the IR3839 data sheet.

BOARD FEATURES

- $V_{in} = +12V$
- $V_{out} = +1.8V @ 0 - 6A$
- $F_s = 600kHz$
- $L = 1.0uH$
- $C_{in} = 4x10uF$ (ceramic 1206) + $1x330uF$ (electrolytic)
- $C_{out} = 6x22uF$ (ceramic 0805)

CONNECTIONS and OPERATING INSTRUCTIONS

A well regulated +12V input supply should be connected to VIN+ and VIN-. A maximum 6A load should be connected to VOUT+ and VOUT-. The connection diagram is shown in Fig. 1 and inputs and outputs of the board are listed in Table I.

IR3839 has only one input supply, the input voltage (V_{in}). Internal LDO circuitry generates V_{cc} voltage (=5.2V).

One option for using a separate +5V supply for V_{cc} voltage, as required in a certain application, is to remove R15 (zero Ohm resistor), which disables the internal LDO circuit. In this case V_{cc} input should be a well regulated 4.5V-7.5V supply and it would be connected to V_{cc+} and V_{cc-} .

Table I. Connections

| Connection | Signal Name |
|------------|----------------------------|
| VIN+ | V_{in} (+12V) |
| VIN- | Ground of V_{in} |
| VOUT+ | V_{out} (+1.8V) |
| VOUT- | Ground of V_{out} |
| Vref | Internal Reference-Voltage |
| SEQ | Sequence input |
| V_{cc+} | VCC/LDO_out pin |
| V_{cc-} | Connected to PGND |
| Sync | Synchronous input |

LAYOUT

The PCB is a 4-layer board. All of layers are 2 Oz. copper. The IR3839 and other components are mounted on the top and bottom side of the board.

Power supply decoupling capacitors, the Bootstrap capacitor and feedback components are located close to IR3839. The feedback resistors are connected to the output voltage at the point of regulation and are located close to IR3839. To improve efficiency, the circuit board is designed to minimize the length of the on-board power ground current path.

PCB Metal and Components Placement

The lead lands (the 13 IC pins) width should be equal to the nominal part lead width. The minimum lead to lead spacing should be $\geq 0.2\text{mm}$ to minimize shorting.

Lead land length should be equal to the maximum part lead length + 0.3 mm outboard extension. The outboard extension ensures a large and inspectable toe fillet.

The pad lands (the 4 big pads other than the 13 IC pins) length and width should be equal to maximum part pad length and width. However, the minimum metal to metal spacing should be no less than 0.17mm for 2 oz. Copper; no less than 0.1mm for 1 oz. Copper and no less than 0.23mm for 3 oz. Copper.

Solder Resist

It is recommended that the lead lands are Non Solder Mask Defined (NSMD). The solder resist should be pulled away from the metal lead lands by a minimum of 0.025mm to ensure NSMD pads.

The land pad should be Solder Mask Defined (SMD), with a minimum overlap of the solder resist onto the copper of 0.05mm to accommodate solder resist mis-alignment.

Ensure that the solder resist in between the lead lands and the pad land is $\geq 0.15\text{mm}$ due to the high aspect ratio of the solder resist strip separating the lead lands from the pad land.

All Dimensions In mm

All Pads are Solder Mask Defined

Stencil Design

- The Stencil apertures for the lead lands should be approximately 80% of the area of the lead lads. Reducing the amount of solder deposited will minimize the occurrences of lead shorts. If too much solder is deposited on the center pad the part will float and the lead lands will be open.
- The maximum length and width of the land pad stencil aperture should be equal to the solder resist opening minus an annular 0.2mm pull back to decrease the incidence of shorting the center land to the lead lands when the part is pushed into the solder paste.

Stencil Aperture
