

ProcessorPM™ Development Kit

User's Guide

Introduction

Thank you for choosing the Lattice Semiconductor ProcessorPM Development Kit!

This user's guide describes how to start using the ProcessorPM Development Kit, an easy-to-use platform for evaluating and designing with the ProcessorPM-POWR605 (Processor Power Manager). Along with the evaluation board and accessories, this kit includes a pre-loaded Processor Support demonstration design. You may also reprogram the ProcessorPM to review your own custom designs.

Note: Static electricity can severely shorten the lifespan of electronic components. See the ProcessorPM Development Kit QuickSTART Guide for handling and storage tips.

Features

The ProcessorPM Development Kit includes:

- **ProcessorPM Evaluation Board** - The ProcessorPM board is a 2.5" x 2" form factor that features the following on-board components and circuits:
 - ProcessorPM-POWR605
 - Power Manager II ispPAC®-POWR6AT6
 - LEDs for general purpose I/O, power indicators, and watchdog timer interrupt indication
 - Slide potentiometer
 - USB B-mini connector for power and programming
 - 2x14 expansion header for general I/O, voltage monitor inputs, and power supply trim outputs
 - Push buttons for reset and watchdog timer trigger
 - 4-bit DIP switch for watchdog timer period programming and reset pulse stretch enable
 - JTAG and I²C header landings for ispDOWNLOAD™ cable programming and I²C interface
- **Pre-loaded Processor Support Demo** - The kit includes a pre-loaded demo design that demonstrates watchdog timer, voltage supervisor, and reset generation features of the ProcessorPM.
- **USB Connector Cable** - The ProcessorPM Evaluation Board is powered from the mini B USB socket when connected to a host PC. The USB channel also provides a programming interface to the ProcessorPM and POWR6AT6 JTAG ports.
- **QuickSTART Guide** - Provides information on connecting the ProcessorPM Evaluation Board, running the pre-loaded processor support demo.
- **ProcessorPM Development Kit Web Page** - The ProcessorPM Development Kit web page provides access to the latest documentation, demo designs, and drivers for the kit.

The contents of this user's guide include demo operation, programming instructions, top-level functional descriptions of the evaluation board, descriptions of the on-board connectors, switches and a complete set of schematics of the ProcessorPM board.

Software Requirements

You should install the following software before you begin developing designs for the evaluation board:

- PAC-Designer® 5.1
- ispVM™ System 17.5

Figure 1. ProcessorPM Evaluation Board, Top Side

Figure 2. ProcessorPM Evaluation Board, Bottom Side

ProcessorPM Device

This board features the ProcessorPM, an in-system programmable, mixed-signal PLD that integrates high-performance analog voltage monitors, 4 timer counter blocks, and a 16-macrocell programmable logic device. A complete description of this device can be found in the [ProcessorPM-POWR605 Data Sheet](#).

Demonstration Designs

Lattice provides two demos that illustrate key applications of the ProcessorPM and Power Manager II POWR6AT6 devices:

- **Processor Support** - Demonstrates the ProcessorPM as a power manager for a processor, DSP, ASSP, or ASIC. It integrates three functions traditionally covered by discrete ICs: voltage supervisor, reset generator, and watchdog timer. The programmable features of the ProcessorPM highlight its flexibility to be used in a variety of system support roles. The processor support demo design is pre-loaded into the ProcessorPM by Lattice.

Note: The processor support demo program (JEDEC) differs slightly from the Initial Factory Configuration described in the ProcessorPM-POWR605 Data Sheet. WDT_Intr output is active-high in the demo program, and active-low in the factory configuration.

- **Voltage Monitoring** - Shows application of the ispPAC-POWR6AT6 to provide supply measurements via an I²C interface. The voltage monitoring support demo design is pre-programmed into the POWR6AT6 by Lattice.

Note: It is possible that you may obtain your ProcessorPM board after it has been reprogrammed. To restore the factory default demo and program it with other Lattice-supplied examples see the Download Demo Designs and Download Windows Hardware Drivers section of this document.

Processor Support Demo

The processor support demo is pre-programmed into the non-volatile elements of the ProcessorPM and POWR6AT6 devices and is operational upon power-up. The design provides the following features:

- Detect voltage supply violations and assert a CPU reset if a fault occurs.
- Provide a 500 ms, 2 sec, 10 sec, or 1 min period watchdog timer and assert a watchdog timer interrupt if a timer expires before a watchdog trigger interrupt occurs.
- Assert CPU reset pulses if manual reset of the board occurs. Provide an optional 200 ms pulse stretch of the reset.
- Debounce manual reset input.

A PAC-Designer software project (.pac) defines the analog trip points for the ProcessorPM voltage monitors, timer-counter period, and supervisory equations that define logical functions.

Figure 3. Processor Support Demo Block Diagram

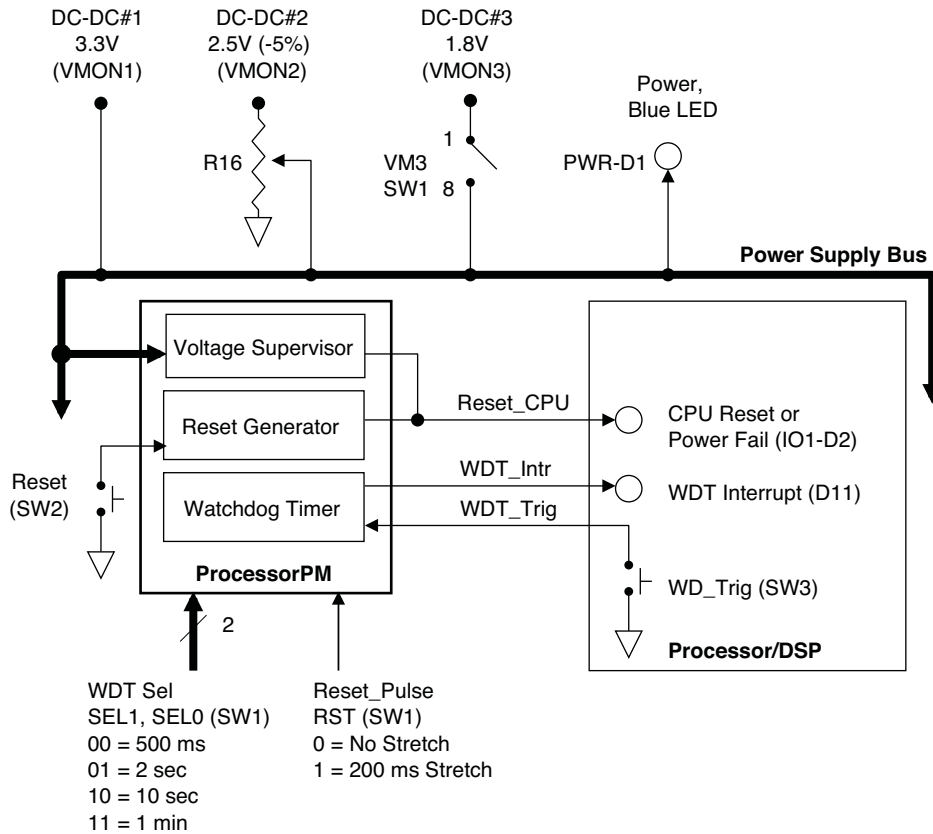

Table 1 describes the DIP switch, push-button inputs, and slide potentiometer settings that control the pre-configured ProcessorPM and emulate a variety of processor support scenarios. Use them as a reference as you follow the procedure. To indicate a '1' (logical True) on the DIP switch SW1, slide the switch towards the number indicated on the switch body. Note the circuit board silkscreen markings for: VM3=1.8, RST=0, SEL0=0, and SEL1=0.

Table 1. Processor Support Demo Switch and Button Settings

Setting	Function
DIP Switch (1, 2, 3, 4)	
XX00	500 ms WDT (SEL0=0, SEL1=0) Enables a 500 ms period watchdog timer (WDT). When active, the ProcessorPM will monitor the terminal count (TC) value a programmable timer. Once 500 ms expires, the WDT_Intr output is asserted. An amber WDT_INT LED (D11) will light momentarily to indicate the WDT interrupt input to the processor/DSP is active. Once activated, you may reset the WDT by pressing the push-button switch (WD_Trig) to emulate a WDT trigger event asserted by the processor/DSP. A red LED D5 will light when SEL0=0 and LED D6 will light when SEL1=0. <i>Note: For the demonstration scenario, an additional transistor circuit of the evaluation board stretches WDT_Intr output period to make the interrupt event visible to the eye.</i>
XX10	2 sec WDT (SEL0=1, SEL1=0) Enables a 2-second period watchdog timer (WDT).
XX01	10 sec WDT (SEL0=0, SEL1=1) Enables a 10-second period watchdog timer (WDT).
XX11	1 min WDT (SEL0=1, SEL1=1) Enables a 1-minute period watchdog timer (WDT).
X0XX	Disable Reset Pulse Stretch (RST=0) Disables the reset pulse stretch option of ProcessorPM. A red LED D4 will light when RST=0.

Table 1. Processor Support Demo Switch and Button Settings (Continued)

Setting	Function
X1XX	Enable 200 ms Reset Pulse Stretch (RST=1) Appends an additional 200 ms period to any processor/DSP reset output asserted by the ProcessorPM. Programmable clock and timer functions of the ProcessorPM allow for a variety of timeout intervals from 32 us to 1.96 sec in 128 steps. It may be necessary to connect a logic analyzer to detect the pulse stretch.
0XXX	1.8V Supply OK (VM3=1.8) Connects the 1.8V supply rail to the voltage monitor input (VMON3) of the ProcessorPM. This setting emulates a stable 1.8V supply.
1XXX	1.8V Supply Failure (VM3=High-Z) Disconnects the 1.8V supply rail from the voltage monitor input (VMON3) of the ProcessorPM. This setting emulates a DC-DC converter or other supply failure on the PCB. The ProcessorPM will assert the Reset_CPU output signal to initiate a reset of the processor/DSP target device. A red LED (D2) will light to indicate the power fail condition.
Push-button Switch	
WD_Trig	WDT Trigger Press the push-button switch (WD_Trig) to emulate the watchdog timer reset trigger issued periodically for normal operation by the processor/DSP.
Reset	Manual Reset Press the push-button switch (Reset) to assert a manual reset of the evaluation board. All timers of the ProcessorPM will be cleared and the Reset_CPU output signal will be asserted.
Slide Potentiometer	
R16	Voltage Supervisor Input A slide potentiometer emulates the variability of a 2.5V voltage rail on the PCB. Slide the pot towards the 0.0V position to lower the voltage level input to the ProcessorPM voltage monitor (VMON2).

Connect to the ProcessorPM Evaluation Board

To power and program the evaluation board you may use a PC USB port or use a combination of an external 5V power supply and a Lattice ispDOWNLOAD Cable (Parallel Port HW-DLN-3C). If your PC does not provide a USB port, see the “Add Support for the Lattice ispDOWNLOAD Cable (HW-DLN-3C)” section.

USB Cable Connection

Use the USB cable provided to connect the evaluation board to your PC:

1. Connect the USB cable from a USB port on your PC to the board's USB mini-B socket (J1) on the bottom left side of the board. After connection is made, a blue Power LED (PWR) will light up indicating the board is powered on.
2. If you are prompted, “Windows may connect to Windows Update” select **No, not this time** from available options and click **Next** to proceed with the installation. Choose the **Install from specific location (Advanced)** option and click **Next**.
3. Select **Search for the best driver in these locations** and click the **Browse** button to browse to the Windows driver folder created in the **Download Windows Hardware Drivers** section. Select the **CDM 2.04.06 WHQL Certified** folder and click **OK**.
4. Click **Next**. A screen will display as Windows copies the required driver files. Windows will display a message indicating that the installation was successful.
5. Click **Finish** to install the USB driver.

ispDOWNLOAD Cable (HW-DLN-3C) Connection

Use the ispDOWNLOAD cable (sold separately) to connect the evaluation board to your PC:

1. Connect external +5V and GND power to pad locations J5 and J6 (Schematic Sheet 5 of 5).
2. Connect the ispDOWNLOAD cable from a parallel port on your PC to the board's JTAG header (J3) (Schematic Sheet 5 of 5) on the right side of the board.

See "Add Support for the Lattice ispDOWNLOAD Cable (HW-DLN-3C)" for information on how to modify the evaluation board to add a JTAG header connection.

Run the Processor Support Demo

The ProcessorPM processor support demo illustrates key functions of the ProcessorPM: voltage supervisor, reset generator, and watchdog timer (WDT). The block diagram of the processor support demo, Figure 3, shows the ProcessorPM interface to a simulated processor/DSP. LEDs and switches are used to emulate the processor interface.

Many processor power management scenarios can be shown with the ProcessorPM evaluation board. Follow the procedure below to emulate one particular case.

1. Set the ProcessorPM configuration to indicate 1.8V Supply OK, disable reset pulse stretch and enable a two-second watchdog timer period.

Select DIP Switch (1, 2, 3, 4) = 0010

Note: To indicate a logical 1, slide the switch towards the 1, 2, 3, or 4 numeral mark on the case. Select the R16 Slider = 3.3V position.

2. Press and then release the Reset push-button.
The ProcessorPM Evaluation Board is reset. The CPU Reset LED (D2) lights to indicate the reset condition. The WDT timer is reset and the two-second WDT count begins.
3. Press and release the WD_Trigger push-button.
The WDT_Trigger signal is asserted by the processor/DSP. The ProcessorPM timer/counter is reset and the two-second watchdog timer restarts.

Continue pressing the WD_Trigger to "pet" the watchdog timer to prevent the two-second timeout.

4. Wait for two seconds and allow the WDT timer period to expire.

The ProcessorPM asserts the WDT_Intr output signal and the WDT_Interrupt LED (D11) lights momentarily to indicate the interrupt condition.

In the next step you will increase the watchdog timer period from 2 seconds to 10 seconds and enable Reset Pulse Stretch.

5. Select SW1 (1, 2, 3, 4) = 0101. Also select the R16 Slider = 3.3V position. Press and release the Reset push-button on the ProcessorPM board.

The CPU Reset LED (D2) light indicates the reset condition. The WDT timer is reset and the 10-second WDT count begins.

The following steps emulate a brown out condition of a 2.5V supply rail output of a DC-to-DC converter (DC-DC#2) monitored by the ProcessorPM.

6. Slowly slide R16 towards the 0.0V position.
Once the ProcessorPM voltage monitor detects the 2.5V supply rail has dropped below a 2.5V-5% threshold value a supply fault will be triggered and the Reset CPU output signal is asserted. The CPU Reset LED (D2) light indicates the reset condition. Note that the ProcessorPM watchdog timer is also disabled.

- Slide R16 toward the 3.3V position. Once the ProcessorPM voltage monitor detects that the 2.5V rail is above a threshold value of 2.5V -5%, the Reset CPU output signal is released. The CPU Reset LED (D2) light goes out.

Run the Voltage Monitoring Demo

The voltage monitor demo illustrates how to access the 2-wire I²C slave interface of the ispPAC-POWR6AT6 device to perform voltage level measurements. This is a popular means for a microcontroller/microprocessor to monitor voltages and adjust the voltage profiles of the POWR6AT6 DC-DC converter margin output drivers. For more information on POWR6AT6 end applications see AN6077 [Stable Operation of DC-DC Converters with Power Manager Closed Loop Trim](#). This demo uses the ispPAC-POWR6AT6 I²C Utility software provided with PAC-Designer software running on a host PC to emulate a processor's interface to the POWR6AT6.

- Modify the evaluation board to use the Lattice ispDOWNLOAD Cable (HW-DLN-3C) for a PC parallel port. See the "Add Support for the Lattice ispDOWNLOAD Cable (HW-DLN-3C)" section for more information.
- Install PAC-Designer software.
- From the PAC-Designer<ver>\Macro directory, run PowerManager_6AT6_I2C_Utility.exe. For more information on the I²C Hardware Verification Utility software and operation see AN6067, [ispPAC-POWR1220AT8 I²C Hardware Verification Utility User's Guide](#).
- Set I²C Address = 6Ah

Download Demo Designs

The processor support demo is preprogrammed into the ProcessorPM Evaluation Board, however over time it is likely your board will be modified. Lattice distributes source and programming files for demonstration designs compatible with the ProcessorPM board.

To download demo designs:

- Browse to the ProcessorPM Development Kit web page of the Lattice web site. Select the Demo Applications download and save the file.
- Extract the contents of "ProcessorPM_DK_DemoSource.zip" to an accessible location on your hard drive.

Two demo design directories (Demo_ProcessorPMDK_<demo>) are unpacked.

Where:

Demo	Directories
Processor Support Demo	Demo_ProcessorPMDK_ProcessorSupport
Voltage Monitoring with the POWR6AT6 Demo	Demo_ProcessorPMDK_VoltageMonitoring

Recompile a Demo Project with PAC-Designer

Use the procedure described below to recompile any of the demo projects for the ProcessorPM Evaluation Board.

- Install and license PAC-Designer software
- Download the demo source files from the ProcessorPM Development Kit web page.
- Run PAC-Designer.
- Open the <demo>.pac project file.
- From the schematic block diagram, double-click the **Sequence Controller block**. The LogiBuilder interface appears.

6. Choose **Tools > Compile LogiBuilder Design**.
After a few moments the JEDEC programming file is output.
7. See the Processor Support Demo section of this document for details on downloading a programming file to the board.

Download Windows Hardware Drivers

If you wish to reprogram the ProcessorPM Evaluation Board, you will need to obtain the necessary hardware drivers for Windows. If your installation of Windows does not automatically install USB drivers when the evaluation board is connected to a USB port, then use the procedure below to download them from the Lattice web site.

To download Windows Hardware Drivers:

1. Browse to the ProcessorPM Development Kit web page, locate the hardware device drivers for the USB/JTAG interface.
2. Download the ZIP file to your system and unzip it to a location on your PC.

Programming with ispVM

The processor support and voltage monitoring demo designs are pre-programmed into the ProcessorPM Evaluation Board by Lattice. To restore a ProcessorPM Evaluation Board to factory settings or load an alternative demo design, use the procedures in this section.

For more information see AN6062, [Using ispVM System to Program ispPAC Devices](#).

To install ispVM programming tools:

1. Install and license ispVM System software.
2. Connect the board to a host PC using the USB port or JTAG header connection.
3. Follow the USB Cable Interface or ispDOWNLOAD Cable Interface procedure below to program the evaluation board.

USB Cable Interface

The ProcessorPM Evaluation Board is equipped with a built-in USB-based programming circuit. This consists of a USB PHY and a USB connector. When the board is connected to a PC with a USB cable, it is recognized by the ispVM System software as a "USB Download Cable". The ProcessorPM and POWR6AT6 can then be scanned and programmed using the ispVM System software.

To program a demo programming file:

1. From the **Start** menu run **ispVM System**.
ispVM appears.
2. Choose **Options > Cable and IO Port Setup...**
The Cable and I/O Port Setup dialog appears.
3. Make the following selections:

Cable Type: **USB2**

Port Setting: **USB2**

Click **OK**.

4. Choose **ispTools > Scan Chain**.
The New Scan Configuration Setup window appears. The POWR605 and POWR6AT6 device(s) appear in the device list.
5. Right-click the ispPAC-POWR605 or ispPAC-POWR6AT6 entry and choose **Edit Device...**
The Device Information dialog appears.
6. From the Data File section, click the **Browse** button.
The Open Data File dialog appears.
7. Browse to the **<Demo Dir>\project** folder, select **<Demo>.jed**, and click **Open**. From the Operation list choose **FLASH Erase, Program, Verify** and click **OK**.
8. Choose **Project > Download**.
ispVM reprograms the evaluation board.

Programming requires about 20-40 seconds. A small, timer window will appear to show elapsed programming time. At the end of programming, the configuration setup window should show a "PASS" in the "Status" column.

ispDOWNLOAD Cable (Parallel Port HW-DLN-3C) Interface

This section describes how to connect and reprogram the evaluation board using HW-DLN-3C.

1. Connect external +5V and GND power to pad locations J5 and J6.
2. Connect the HW-DLN-3C ispDOWNLOAD cable between J3 header and the parallel port of your PC.
3. Run ispVM software to program the ProcessorPM board.
4. Follow the procedure of "USB Cable Interface" to configure ispVM and download JEDEC files to selected devices. Use Cable Type "LATTICE" for Cable and I/O Port Setup.

ProcessorPM Evaluation Board

This section describes the features of the ProcessorPM evaluation board in detail.

Overview

The ProcessorPM Evaluation Board is a complete development platform for the Lattice ProcessorPM mixed-signal PLD. The board includes circuitry to emulate a processor/DSP interface, a USB program/power port, and an expansion header to support test connections. A Power Manager II ispPAC-POWR6AT6 is included and can be programmed to demonstrate power supply margin and trim applications. The board is powered by a PC USB port and you may reprogram the board using ispVM software. If no USB port is available for your PC, the board can be modified such that it can be powered with an external power supply and programmed with the ispDOWNLOAD cable (sold separately) from a PC parallel port.

Figure 4. ProcessorPM Evaluation Board Block Diagram

Table 2 describes the components on the board and the interfaces it supports.

Table 2. ProcessorPM Evaluation Board Components and Interfaces

Component/Interface	Type	Schematic Reference	Description
Circuits			
Pulse Stretch Circuit	Circuit	Q4, D10, D11	Stretch watchdog interrupt pulse outputs to 40 ms.
USB Controller	Circuit	U4:FT2232D	USB-to-JTAG interface and dual USB UART/FIFO IC.
USB Mini B Socket	I/O	J1:USB_MINI_B	Programming and debug interface.
Components			
Power Manager II	Mixed Signal PLD	U3: ispPAC-POWR6AT6	Voltage monitor, margin, trim.
ProcessorPM	Mixed Signal PLD	U1:ispPAC-POWR605	Watchdog timer, voltage supervisor, reset generator
Interfaces			
8x1 Header Landing	I/O	J2:I ² C	I ² C interface.
8x1 Header Landing	I/O	J3:JTAG Interface	JTAG interface.
14x2 Header	I/O	J6:HEADER 14X2	User-definable I/O.
5 LEDs	Output	D7-D0	User-definable LEDs, I/O1 to I/O5.
DIP Switch	I/O	SW1A, B, C, and D	4-bit DIP switch.
Push-button Switches	I/O	SW2:Reset, SW3:WD_Trigger	General-purpose push-buttons.
Slide Potentiometer	I/O	R16	Potentiometer tied to 3.3V rail. Emulates brown-out 2.5V conditions at VMON2 inputs of ProcessorPM and POWR6AT6.

Subsystems

This section describes the principle sub-systems for the ProcessorPM Evaluation Board in alphabetical order. When reviewing the board, orient it so the silkscreen markings are readable.

DIP Switch

The evaluation board includes a four-bit input toggle switch located on the SE corner of the board. Three are available as general purpose inputs. Slide the switch toward the numeral mark on the switch case to indicate a logical '1'.

Table 3. DIP Switch Reference

C/3	Watchdog Delay SEL0 user-defined input	17
B/2	Reset Pulse Stretch enable or user-defined input	18
A/1	3.3V supply rails to VMON3 connection	4

Expansion Header

The expansion header provides 28 user I/Os connected to the ProcessorPM and POWR6AT6. The remaining pins serve as power for expansion boards. The expansion connector is configured as one 16x2 100mil centered pin header.

JTAG Interface Circuits

For power and programming, an FTDI USB UART/FIFO IC converter provides a communication interface between a PC host and the JTAG programming chain of the ProcessorPM board. The USB 5V supply is also used as a source for the 3.3V and 1.8V supply rails. A USB B-type mini socket is provided for the USB connector cable.

The evaluation board can be modified to use the Lattice ispDOWNLOAD cable (HW-DLN-3C) for programming. See the “Add Support for the Lattice ispDOWNLOAD Cable (HW-DLN-3C)” section for more information.

LEDs

Five red LEDs (D2-D6) are used to reflect I/Os of the preprogrammed processor support demo. Three of the five LEDs are connected to DIP switch inputs. The LEDs are located in the center of the board, next to the expansion header. You may use D2-D6 for user-defined outputs for your own custom ProcessorPM designs.

A blue LED (POWER - D1) is used to indicate USB 5V power.

An amber LED (D11) is used to indicate interrupt events asserted by the ProcessorPM.

Pulse Stretch Circuit

The pulse stretch circuit (Schematic Sheet 4 of 5) produces a ~40 ms period pulse so watchdog timer interrupt outputs are visible to the eye. When active, an amber LED (D11) will light. The actual output pulse generated by the ProcessorPM is 6 μ s.

Push-button Switches

The board has two momentary push-button switches (SW2 and SW3) to support the pre-loaded processor support demo. SW2 is tied to a ProcessorPM input pin (IN1) which asserts the Reset input. SW3 is tied to a ProcessorPM input pin (IN2) which asserts the watchdog trigger (WD_Trig) input. You may use SW2/SW3 for user-defined inputs for your own custom ProcessorPM designs.

Modifying the ProcessorPM Evaluation Board

The ProcessorPM Evaluation Board provides landing areas for additional circuits to support the following functions:

- Additional voltage supervisor input circuits
- Measure power-down current draw of the ProcessorPM device
- Bypass devices in the JTAG programming chain
- Powering the board with an external 5V supply
- Programming the board with an ispDOWNLOAD Cable for a PC parallel port
- Interfacing to the PAC-Designer I²C Utility software for the POWR6AT6 Power Manager II

Note: Modifying your board requires good electronics handling and PCB fabrication techniques to avoid damage.

Add Support for the Lattice ispDOWNLOAD Cable (HW-DLN-3C)

This section describes how to modify the ProcessorPM board to use the Lattice HW-DLN-3C ispDOWNLOAD cable for JTAG programming or I²C communications from a PC parallel port. The JTAG header interface is required if your PC does not provide a USB port interface and you wish to reprogram the board. The I²C header interface is required to communicate with the PAC-Designer POWR6AT6 I²C Utility program.

To modify the evaluation board to support HW-DLN-3C:

1. Remove R45 (Schematic Sheet 2 of 5).
2. Install R35 (Schematic Sheet 2 of 5).
3. Install an 8-pin header at location J3 - JTAG Interface (Schematic Sheet 5 of 5).
4. Install R28 and R29 (Schematic Sheet 5 of 5).
5. Install an 8-pin header at location J2 - I²C Interface (Schematic Sheet 5 of 5).

See ispDOWNLOAD Cable (Parallel Port HW-DLN-3C) for information on programming through the J3 - JTAG header.

Add Voltage Supervisor Circuits

This section describes how to modify the ProcessorPM Evaluation Board for additional voltage supervisor demonstrations. Add a pair of resistors for each additional voltage monitor input channel that you require to the on-board voltage supervisor circuits (Schematic Sheet 3 of 5) at positions R21/R22, R23/R24, and R25/R26. Each supervisor circuit is a voltage divider with the following characteristics:

- 1% accurate resistors
- $y_k \leq 3k$ ohms
- Select x and y resistor values so $V_{MON} = 0.669V$
- Install Zener diodes if $V_{RAIL} > 5.5V$
- Remove 100k ohm for higher accuracy

You may attach prototype circuits or test equipment to the VMON inputs using J4 - HEADER 14X2 (Schematic Sheet 5 of 5).

For more information on sensor circuit interfaces to Power Manager II and ProcessorPM devices, see AN6041, [Extending the Input Range of the ispPAC-POWR1208](#).

Measure Power-Down Current of the ProcessorPM

This section describes how to modify the ProcessorPM power supply connections to support current measurements.

1. Remove R43 and R44 (Schematic Sheet 1 of 5).
2. Install jumper at location J12 (PM_VCC) (Schematic Sheet 1 of 5).
3. Attach ammeter to pins 1 and 2 of J12.

JTAG Chain Bypass

This section describes how to selectively bypass the ProcessorPM or POWR6AT6 devices in the JTAG programming chain.

1. JTAG TMS bypass: Remove R42 (ProcessorPM TMS) or R41 (POWR6AT6 TMS) to bypass either device. To reverse the bypass you may install jumpers at locations J10 or J11 to reconnect the TMS circuit (Schematic Sheet 1 of 5).
2. Install 10k ohm resistors at locations R39 and R40 (Schematic Sheet 1 of 5).
3. JTAG TDI/TDO bypass: Install jumpers at locations J7 (Bypass 605/7) or J8 (Bypass 6AT6) to break the TDI/TDO circuit.

Mechanical Specifications

Dimensions: 2 1/2 in. [L] x 2 in. [W] x 3/8 in. [H]

Environmental Requirements

The evaluation board must be stored between -40° C and 100° C. The recommended operating temperature is between 0° C and 55° C.

The evaluation board can be damaged without proper anti-static handling.

Glossary

CPLD: Complex Programmable Logic Device

DIP: Dual in-line package.

I²C: Inter-Integrated Circuit.

LED: Light Emitting Diode.

Mixed-Signal PLD: A PLD integrated with analog and mixed signal support circuitry.

PCB: Printed Circuit Board.

RoHS: Restriction of Hazardous Substances Directive.

PLL: Phase Locked Loop.

SPI: Serial Peripheral Interface.

SRAM: Static Random Access Memory.

TransFR™: Transparent Field Reconfiguration.

UART: Universal Asynchronous Receiver/Transmitter.

USB: Universal Serial Bus.

WDT: Watchdog timer
