

MAX14783E

High-Speed 3.3V/5V RS-485/RS-422 Transceiver with $\pm 35\text{kV}$ HBM ESD Protection

General Description

The MAX14783E is a half-duplex RS-485/422 transceiver that operates at either 3.3V or 5V rails with high $\pm 35\text{kV}$ ESD performance and up to 42Mbps data rate. The device is optimized for high speeds over extended cable runs while maximizing tolerance to noise.

The MAX14783E is available in 8-pin $\mu\text{MAX}^{\text{®}}$, 8-pin SO, and 8-pin TDFN-EP packages. The device in the TDFN-EP package operates over the -40°C to $+125^{\circ}\text{C}$ temperature range. The MAX14783E in the μMAX and SO packages operates over the -40°C to $+85^{\circ}\text{C}$ and -40°C to $+125^{\circ}\text{C}$ temperature ranges.

Applications

- Motion Controllers
- Field Bus Networks
- Encoder Interfaces
- Backplane Busses

Benefits and Features

- Integrated Protection Increases Robustness
 - High ESD Protection
 - $\pm 35\text{kV}$ HBM ESD per JEDEC JS-001-2012
 - $\pm 20\text{kV}$ Air Gap per IEC 61000-4-2
 - $\pm 12\text{kV}$ Contact ESD per IEC 61000-4-2
 - Short-Circuit Protected Outputs
 - True Fail-Safe Receiver Prevents False Transition on Receiver Input Short or Open Events
 - Hot-Swap Capability Eliminates False Transitions During Power-Up or Hot Insertion
- 3V to 5.5V Supply Voltage Range
- High-Speed Data Rates up to 42Mbps
- -40°C to $+125^{\circ}\text{C}$ Operating Temperature
- Allows Up to 32 Transceivers on the Bus
- Low $10\mu\text{A}$ (max) Shutdown Current for Lower Power Consumption

Ordering Information appears at end of data sheet.

Absolute Maximum Ratings

(Voltages referenced to GND.)

V _{CC}	-0.3V to +6.0V
RO	-0.3V to (V _{CC} + 0.3V)
RE, DE, DI	-0.3V to +6.0V
A, B (V _{CC} ≥ 3.6V)	-8.0V to +13.0V
A, B (V _{CC} < 3.6V)	-9.0V to +13.0V
Short-Circuit Duration (RO, A, B) to GND	Continuous
Operating Temperature Range	
MAX14783EE_	-40°C to +85°C
MAX14783EA_	-40°C to +125°C

Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Continuous Power Dissipation (T _A = +70°C)	
μMAX (derate at 4.8mW/°C above +70°C)	387mW
SO (derate at 7.6mW/°C above +70°C)	606mW
TDFN-EP (derate at 24.4mW/°C above +70°C)	1951mW
Lead Temperature (soldering, 10s)	+300°C
Soldering Temperature (reflow)	+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Thermal Characteristics (Note 1)

Junction-to-Case Thermal Resistance (θ _{JC})		Junction-to-Ambient Thermal Resistance (θ _{JA})	
8-pin μMAX	42°C/W	8-pin μMAX	206°C/W
8-pin SO	38°C/W	8-pin SO	132°C/W
8-pin TDFN-EP	8°C/W	8-pin TDFN-EP	41°C/W

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Electrical Characteristics

(V_{CC} = +3.0V to +5.5V, T_A = T_{MIN} to T_{MAX}, unless otherwise specified. Typical values are at V_{CC} = +5V and T_A = +25°C.) (Notes 2, 3)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
POWER SUPPLY						
Supply Voltage	V _{CC}		3.0		5.5	V

Note 2: All devices 100% production tested at T_A = +25°C. Specifications over temperature are guaranteed by design.**Note 3:** All currents into the device are positive; all currents out of the device are negative. All voltages are referenced to ground, unless otherwise noted.**Note 4:** ΔV_{OD} and ΔV_{OC} are the changes in V_{OD} and V_{OC}, respectively, when the DI input changes state.**Note 5:** Capacitive load includes test probe and fixture capacitance.**Note 6:** Guaranteed by design; not production tested.**Note 7:** The timing parameter refers to the driver or receiver enable delay, when the device has exited the initial hot-swap protect state and is in normal operating mode.**Note 8:** Shutdown is enabled by driving $\overline{\text{RE}}$ high and DE low. The device is guaranteed to have entered shutdown after t_{SHDN} has elapsed.

Pin Configuration

Pin Description

PIN	NAME	FUNCTION
1	RO	Receiver Output. See <i>Function Tables</i> .
2	\overline{RE}	Receiver Output Enable. Drive \overline{RE} low to enable RO. Drive \overline{RE} high to disable the receiver. RO is high impedance when \overline{RE} is high. Drive \overline{RE} high and pull DE low to enter low-power shutdown mode.
3	DE	Driver Output Enable. Drive DE high to enable the driver. Drive DE low to disable the driver. Driver outputs are high-impedance when the driver is disabled. Drive \overline{RE} high and pull DE low to enter low-power shutdown mode.
4	DI	Driver Input. With DE high, a low on DI forces the A output low and the B output high. Similarly, a high on DI forces the A output high and B output low.
5	GND	Ground
6	A	Noninverting RS-485/RS-422 Receiver Input and Driver Output
7	B	Inverting RS-485/RS-422 Receiver Input and Driver Output
8	V _{CC}	Positive Supply Voltage Input. Bypass V _{CC} with a 0.1μF ceramic capacitor to ground.
—	EP	Exposed Pad (TDFN only). Connect EP to GND.

1	0	X	High Impedance		Shutdown

X = Don't care

on M1. Transistors M2 (a 500µA current sink) and M1 (a 100µA current sink) pull DE to GND through a 5kΩ (typ) resistor. M2 is designed to pull DE to the disabled state against an external parasitic capacitance up to 100pF that can drive DE high. After 10µs, the timer deactivates M2 while M1 remains on, holding DE low against three-state leakages that can drive DE high. M1 remains on until an external source overcomes the required input current. At this time, the SR latch resets and M1 turns off. When M1 turns off, DE reverts to a standard, high-impedance CMOS input. Whenever V_{CC} drops below 1V, the hot-swap input is reset.

A complementary circuit employing two pMOS devices pulls RE to V_{CC}.

±35kV ESD Protection

ESD protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The driver outputs and receiver inputs of the MAX14783E have extra protection against static electricity. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, the MAX14783E keeps working without latch-up or damage.

ESD protection can be tested in various ways. The transmitter outputs and receiver inputs of the MAX14783E are characterized for protection to the following limits:

- ±35kV HBM
- ±20kV using the Air-Gap Discharge method specified in IEC 61000-4-2
- ±12kV using the Contact Discharge method specified in IEC 61000-4-2

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

Human Body Model (HBM)

Figure 10 shows the HBM, and Figure 11 shows the current waveform it generates when discharged into a low-impedance state. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

IEC 61000-4-2

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment. However, it does not specifically refer to integrated circuits. The MAX14783E helps in designing equipment to meet IEC 61000-4-2 without the need for additional ESD protection components.

The major difference between tests done using the HBM and IEC 61000-4-2 is higher peak current in IEC 61000-4-2 because series resistance is lower in the IEC 61000-4-2 model. Hence, the ESD withstand voltage measured to IEC 61000-4-2 is generally lower than that measured using the HBM.

Figure 10. Human Body ESD Test Model

Figure 11. Human Body Current Waveform

Figure 12 shows the IEC 61000-4-2 model, and Figure 13 shows the current waveform for IEC 61000-4-2 ESD Contact Discharge test.

Applications Information

Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or by bus connection. The first, a current limit on the output stage provides immediate protection against short circuits over the whole common-mode voltage range. The second, a thermal-shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature exceeds +160°C (typ).

Low-Power Shutdown Mode

Low-power shutdown mode is initiated by bringing \overline{RE} high and DE low. In shutdown, the devices draw less than 10µA of supply current.

\overline{RE} and DE can be connected together and driven simultaneously. The MAX14783E is guaranteed not to enter shutdown if \overline{RE} is high and DE is low for less than 50ns. If the inputs are in this state for at least 800ns (max), the device is guaranteed to enter shutdown.

Typical Applications

The MAX14783E transceiver is designed for bidirectional data communications on multipoint bus transmission lines. Figure 14 shows a typical network application circuit. To minimize reflections, terminate the line at both ends with its characteristic impedance and keep stub lengths off the main line as short as possible.
