# 1-of-16 decoder/demultiplexer with input latches

**HEF4514B**  
**MSI**

**DESCRIPTION**

The HEF4514B is a 1-of-16 decoder/demultiplexer, having four binary weighted address inputs ( $A_0$  to  $A_3$ ), a latch enable input (EL), and an active LOW enable input ( $\bar{E}$ ). The 16 outputs ( $O_0$  to  $O_{15}$ ) are mutually exclusive active HIGH. When EL is HIGH, the selected output is determined by the data on  $A_n$ . When EL goes LOW, the

last data present at  $A_n$  are stored in the latches and the outputs remain stable. When  $\bar{E}$  is LOW, the selected output, determined by the contents of the latch, is HIGH. At  $\bar{E}$  HIGH, all outputs are LOW. The enable input ( $\bar{E}$ ) does not affect the state of the latch. When the HEF4514B is used as a demultiplexer,  $\bar{E}$  is the data input and  $A_0$  to  $A_3$  are the address inputs.

**PINNING**

- $A_0$  to  $A_3$  address inputs
- $\bar{E}$  enable input (active LOW)
- EL latch enable input
- $O_0$  to  $O_{15}$  outputs (active HIGH)

- HEF4514BP(N): 24-lead DIL; plastic (SOT101-1)
- HEF4514BD(F): 24-lead DIL; ceramic (cerdip) (SOT94)
- HEF4514BT(D): 24-lead SO; plastic (SOT137-1)
- ( ): Package Designator North America

**APPLICATION INFORMATION**

Some examples of applications for the HEF4514B are:

- Digital multiplexing.
- Address decoding.
- Hexadecimal/BCD decoding.

**FAMILY DATA, I<sub>DD</sub> LIMITS category MSI**

Notes

- EL = HIGH; H = HIGH state (the more positive voltage);  
L = LOW state (the less positive voltage); X = state is immaterial
