PXR40 Microcontroller Data Sheet

TEPBGA-416
27mm x 27mm

- Dual issue, 32-bit CPU core complex (e200z7)
 - Compliant with the Power Architecture embedded category
 - 16 KB I-Cache and 16 KB D-Cache
 - Includes an instruction set enhancement allowing variable length encoding (VLE), optional encoding of mixed 16-bit and 32-bit instructions, for code size footprint reduction
 - Includes signal processing extension (SPE2) instruction support for digital signal processing (DSP) and single-precision floating point operations
- 4 MB on-chip flash
 - Supports read during program and erase operations, and multiple blocks allowing EEPROM emulation
- 256 KB on-chip general-purpose SRAM including 32 KB of standby RAM
- Two direct memory access controller (eDMA2) blocks
 - One supporting 64 channels
 - One supporting 32 channels
- Interrupt controller (INTC)
- Frequency modulated phase-locked loop (FMPLL)
- Crossbar switch architecture for concurrent access to peripherals, flash, or RAM from multiple bus masters
- External bus interface (EBI) for calibration and application development (not available on all packages)
- System integration unit (SIU)
- Error correction status module (ECSM)
- Boot assist module (BAM) supports serial bootstrap via CAN or SCI
- Two second-generation enhanced time processor units (eTPU2) that share code and data RAM.
 - 32 standard channels per eTPU2
 - 24 KB code RAM
 - 6 KB parameter (data) RAM
- Enhanced modular input output system supporting 32 unified channels (eMIOS) with each channel capable of single action, double action, pulse width modulation (PWM) and modulus counter operation
- Four enhanced queued analog-to-digital converters (eQADC)
 - Support for 64 analog channels
 - Includes one absolute reference ADC channel
 - Includes eight decimation filters
- Four deserial serial peripheral interface (SPI) modules
- Three enhanced serial communication interface (UART) modules
- Four controller area network (CAN) modules
- Dual-channel FlexRay controller
- Nexus development interface (NDI) per IEEE-ISTO 5001-2003/5001-2008 standard
- Device and board test support per Joint Test Action Group (JTAG) (IEEE 1149.1)
- On-chip voltage regulator controller regulates supply voltage down to 1.2 V for core logic

1 PXR40 features

Table 1 displays the PXR40 feature set.

Table 1. PXR40 feature set

Feature	PXR40
Core	e200z7
SIMD	Yes
VLE	Yes
Cache	32 KB (16 KB Instruction/16 KB Data)
Non-maskable interrupt (NMI)	NMI & Critical Interrupt
MMU	64 entry
MPU	Yes
XBAR	5 × 5
Windowing software watchdog	Yes
Nexus	3+
SRAM	256 KB
Flash	4 MB
Flash fetch accelerator	4 × 256 bit (first 1 MB of memory is 4 × 128; last 3 MB are 4 × 256)

4 Signal properties and muxing

Table 2 shows the signals properties for each pin on the PXR40. For each port pin that has an associated SIU_PCR_n register to control its pin properties, the supported functions column lists the functions associated with the programming of the SIU_PCR_n[PA] bit in the order: Primary function (P), Function 2 (F2), Function 3 (F3), and GPIO (G). See Figure 7.

¹ The GPIO number is the same as the corresponding pad configuration register (SIU_PCRn) number in pins that have GPIO functionality. For pins that do not have GPIO functionality, this number is the PCR number.

² The primary signal name is used as the pin label on the BGA map for identification purposes. However, the primary signal function is not available on all devices and is indicated by a dash in the following table columns: Signal Functions, P/F/G, and I/O Type.

³ P/A/G stands for Primary/Alternate/GPIO. This column indicates which function on a pin is Primary, Alternate 1, Alternate 2, (Alternate *n*) and GPIO.

⁴ Each line in the Function column corresponds to a separate signal function on the pin. For all device I/O pins, the primary, alternate, or GPIO signal functions are designated in the PA field of the SIU_PCRn registers except where explicitly noted.

⁵ MH = High voltage, medium speed

F = Fast speed

FS = Fast speed with slew

AE = Analog with ESD protection circuitry (up/down = pull up and pull down circuits included in the pad)

VHV = Very high voltage

⁶ VDDE (fast I/O) and VDDEH (slow I/O) power supply inputs are grouped into segments. Each segment of VDDEH pins can connect to a separate 3.3–5.0 V (+5%–10%) power supply input. Each segment of VDDE pins can connect to a separate 1.8–3.3 V (±10%) power supply.

⁷ The Status During Reset pin is sampled after the internal POR is negated. Prior to exiting POR, the signal has a high impedance. The terminology used in this column is: O – output, I – input, Up – weak pull up enabled, Down – weak pulldown enabled, Low – output driven low, High – output driven high, ABS — Auto Baud Select (during Reset or until JCOMP assertion). A dash on the left side of the slash denotes that both the input and output buffers for the pin are off. A dash on the right side of the slash denotes that there is no weak pull up/down enabled on the pin. The signal name to the left or right of the slash indicates the pin is enabled.

⁸ The Function After Reset of a GPI function is general purpose input. A dash on the left side of the slash denotes that both the input and output buffers for the pin are off. A dash on the right side of the slash denotes that there is no weak pull up/down enabled on the pin.

- ⁹ This signal name includes eTPU_C functionality that this device does not have. This is for forward compatibility with devices that have an eTPU_C.
- ¹⁰ During and just after POR negates, internal pull resistors can be enabled, resulting in as much as 4 mA of current draw. The pull resistors are disabled when the system clock propagates through the device.
- ¹¹ NMI does not have a PCR PA configuration; it is enabled when NMI is enabled through the SIU_IREER and SIU_IFEER registers.
- ¹² Nexus reset is different than system reset; MDO 1-11 are enabled when trace (RPM or FPM) is enabled, and MDO 12-15 when FPM trace is enabled. MSEO and MCKO are also dependent on trace (RPM or FPM) being enabled.
- ¹³ The Nexus pins don't have a "primary" function as they are not configured by the SIU. The pins are selected by asserting JCOMP and configuring the NPC. SIU values have no effect on the function of these pins once enabled.
- ¹⁴ MCKO is disabled from reset; it can be enabled from the tool (controlled by Nexus NPC_PCR register).
- ¹⁵ Do not connect pin directly to a power supply or ground.

5 Electrical characteristics

This section contains detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications for the PXR40.

The electrical specifications are preliminary and are from previous designs, design simulations, or initial evaluation. These specifications may not be fully tested or guaranteed at this stage of the product life cycle, however for production silicon these specifications will be met. Finalized specifications will be published after complete characterization and device qualifications have been completed.

- ¹ Functional operating conditions are given in the DC electrical specifications. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the listed maxima may affect device reliability or cause permanent damage to the device.
- ² 2.0 V for 10 hours cumulative time, 1.32 V +10% for time remaining.
- ³ 6.4 V for 10 hours cumulative time, 5.25 V +10% for time remaining.
- ⁴ Voltage overshoots during a high-to-low or low-to-high transition must not exceed 10 seconds per instance.
- ⁵ 5.3 V for 10 hours cumulative time, 3.60 V +10% for time remaining.
- ⁶ PXR40 has two analog power supply pins on the pinout: VDDA_A and VDDA_B.
- ⁷ PXR40 has two analog ground supply pins on the pinout: VSSA_A and VSSA_B.
- ⁸ PXR40 has two analog low reference voltage pins on the pinout: VRL_A and VRL_B.
- ⁹ PXR40 has two analog high reference voltage pins on the pinout: VRH_A and VRH_B.
- ¹⁰ Total injection current for all pins must not exceed 25 mA at maximum operating voltage.
- ¹¹ Injection current of ± 5 mA allowed for limited duration for analog (ADC) pads and digital 5 V pads. The maximum accumulated time at this current shall be 60 hours. This includes an assumption of a 5.25 V maximum analog or V_{DDEH} supply when under this stress condition.
- ¹² Total injection current for all analog input pins must not exceed 15 mA.
- ¹³ Lifetime operation at these specification limits is not guaranteed.
- ¹⁴ Solder profile per CDF-AEC-Q100.
- ¹⁵ Moisture sensitivity per JEDEC test method A112.

5.2 Thermal characteristics

Table 4. Thermal characteristics, 416-pin TEPBGA package¹

Characteristic	Symbol	Value	Unit

Junction to Board ⁵	$R_{\theta JB}$	9	°C/W
Junction to Case ⁶	$R_{\theta JC}$	6	°C/W
Junction to Package Top ⁷ Natural Convection	Ψ_{JT}	2	°C/W

- ¹ Thermal characteristics are targets based on simulation that are subject to change per device characterization. This data is PRELIMINARY based on similar package used on other devices.
- ² Junction temperature is a function of on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
- ³ Per JEDEC JESD51-2 with the single layer board horizontal. Board meets JESD51-9 specification.
- ⁴ Per JEDEC JESD51-6 with the board horizontal.
- ⁵ Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
- ⁶ Indicates the average thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1) with the cold plate temperature used for the case temperature.
- ⁷ Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

5.2.1 General notes for specifications at maximum junction temperature

An estimation of the chip junction temperature, T_J , can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} * P_D) \quad \text{Eqn. 1}$$

where:

T_A = ambient temperature for the package ($^{\circ}\text{C}$)

$R_{\theta JA}$ = junction to ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)

P_D = power dissipation in the package (W)

The junction to ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. Unfortunately, there are two values in common usage: the value determined on a single layer board and the value obtained on a board with two planes. For packages such as the TEPBGA, these values can be different by a factor of two. Which value is closer to the application depends on the power dissipated by other components on the board. The value obtained on a single layer board is appropriate for the tightly packed printed circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated.

When a heat sink is used, the thermal resistance is expressed as the sum of a junction to case thermal resistance and a case to ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA} \quad \text{Eqn. 2}$$

where:

$R_{\theta JA}$ = junction to ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)

$R_{\theta JC}$ = junction to case thermal resistance ($^{\circ}\text{C}/\text{W}$)

$R_{\theta CA}$ = case to ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user controls the thermal environment to change the case to ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the size of the heat sink, the air flow around the device, the interface material, the mounting arrangement on printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device.

To determine the junction temperature of the device in the application when heat sinks are not used, the Thermal Characterization Parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} * P_D) \quad \text{Eqn. 3}$$

where:

T_T = thermocouple temperature on top of the package ($^{\circ}\text{C}$)

Ψ_{JT} = thermal characterization parameter ($^{\circ}\text{C}/\text{W}$)

P_D = power dissipation in the package (W)

The thermal characterization parameter is measured per JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over about 1 mm. of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

¹ VRC linear regulator is capable of sourcing a current up to 20 mA and sinking a current up to 500 µA. When using the recommended ballast transistor the maximum output current provided by the voltage regulator VRC/ballast to the VDD core voltage is up to 1A.

² Parameter cannot be tested; this value is based on simulation and characterization.

5.6 Power up/down sequencing

There is no power sequencing required among power sources during power up and power down in order to operate within specification as long as the following two rules are met:

- When VDDREG is tied to a nominal 3.3V supply, VDD33 and VDDSYN must be both shorted to VDDREG.
- When VDDREG is tied to a 5V supply, VDD33 and VDDSYN must be tied together and shall be powered by the internal 3.3V regulator.

The recommended power supply behavior is as follows: Use 25 V/millisecond or slower rise time for all supplies. Power up each V_{DDE}/V_{DDEH} first and then power up V_{DD}. For power down, drop V_{DD} to 0 V first, and then drop all V_{DDE}/V_{DDEH} supplies. There is no limit on the fall time for the power supplies.

Although there are no power up/down sequencing requirements to prevent issues like latch-up, excessive current spikes, etc., the state of the I/O pins during power up/down varies according to Table 9 and Table 10.

Table 9. Power sequence pin states for MH and AE pads

VDD	VDD33	VDDE	MH Pad	MH+LVDS Pads ¹	AE/up-down Pads
High	High	High	Normal operation	Normal operation	Normal operation
—	Low	High	Pin is tri-stated (output buffer, input buffer, and weak pulls disabled)	Outputs driven high	Pull-ups enabled, pull-downs disabled
Low	High	Low	Output low, pin unpowered	Outputs disabled	Output low, pin unpowered
Low	High	High	Pin is tri-stated (output buffer, input buffer, and weak pulls disabled)	Outputs disabled	Pull-ups enabled, pull-downs disabled

¹ MH+LVDS pads are output-only.

¹ The pad pre-drive circuitry will function normally but since VDDE is unpowered the outputs will not drive high even though the output pmos can be enabled.

5.6.1 Power-up

If V_{DDE}/V_{DDEH} is powered up first, then a threshold detector tristates all drivers connected to V_{DDE}/V_{DDEH} . There is no limit to how long after V_{DDE}/V_{DDEH} powers up before V_{DD} must power up. If there are multiple V_{DDE}/V_{DDEH} supplies, they can be powered up in any order. For each V_{DDE}/V_{DDEH} supply not powered up, the drivers in that V_{DDE}/V_{DDEH} segment exhibit the characteristics described in the next paragraph.

If V_{DD} is powered up first, then all pads are loaded through the drain diodes to V_{DDE}/V_{DDEH} . This presents a heavy load that pulls the pad down to a diode above V_{SS} . Current injected by external devices connected to the pads must meet the current injection specification. There is no limit to how long after V_{DD} powers up before V_{DDE}/V_{DDEH} must power up.

The rise times on the power supplies are to be no faster than 25 V/millisecond.

5.6.2 Power-down

If V_{DD} is powered down first, then all drivers are tristated. There is no limit to how long after V_{DD} powers down before V_{DDE}/V_{DDEH} must power down.

If V_{DDE}/V_{DDEH} is powered down first, then all pads are loaded through the drain diodes to V_{DDE}/V_{DDEH} . This presents a heavy load that pulls the pad down to a diode above V_{SS} . Current injected by external devices connected to the pads must meet the current injection specification. There is no limit to how long after V_{DDE}/V_{DDEH} powers down before V_{DD} must power down.

There are no limits on the fall times for the power supplies.

5.6.3 Power sequencing and POR dependent on V_{DDA}

During power up or down, V_{DDA} can lag other supplies (of magnitude greater than $V_{DDEH}/2$) within 1 V to prevent any forward-biasing of device diodes that causes leakage current and/or POR. If the voltage difference between V_{DDA} and V_{DDEH} is more than 1 V, the following will result:

- Triggers POR (ADC monitors on V_{DDEH1} segment which powers the RESET pin) if the leakage current path created, when V_{DDA} is sufficiently low, causes sufficient voltage drop on V_{DDEH1} node monitored crosses low-voltage detect level.
- If V_{DDA} is between 0–2 V, powering all the other segments (especially V_{DDEH1}) will not be sufficient to get the part out of reset.
- Each V_{DDEH} will have a leakage current to V_{DDA} of a magnitude of $((V_{DDEH} - V_{DDA} - 1 \text{ V (diode drop)})/200 \text{ KOhms})$ up to $(V_{DDEH}/2 = V_{DDA} + 1 \text{ V})$.

- Each V_{DD} has the same behavior; however, the leakage will be small even though there is no current limiting resistor since $V_{DD} = 1.32\text{ V max.}$

- ²⁰ Absolute value of current, measured at V_{IL} and V_{IH}.
- ²¹ Weak pull up/down inactive. Measured at V_{DDE} = 3.6 V and V_{DDEH} = 5.25 V. Applies to pad types F and MH.
- ²² Maximum leakage occurs at maximum operating temperature. Leakage current decreases by approximately one-half for each 8 to 12 °C, in the ambient temperature range of 50 to 125 °C. Applies to pad types AE and AE/up-down. See [Section 4 Signal properties and muxing](#).
- ²³ This programmable option applies only to eQADC differential input channels and is used for biasing and sensor diagnostics
- ²⁴ Pull-up and pull-down resistances are both enabled and settings are equal.

5.7.1 I/O pad current specifications

The power consumption of an I/O segment is dependent on the usage of the pins on a particular segment. The power consumption is the sum of all output pin currents for a particular segment. The output pin current can be calculated from [Table 12](#) based on the voltage, frequency, and load on the pin. Use linear scaling to calculate pin currents for voltage, frequency, and load parameters that fall outside the values given in [Table 12](#).

The AC timing of these pads are described in the [Section 5.11.2 Pad AC specifications](#).

5.7.2 I/O pad V_{DD33} current specifications

The power consumption of the V_{DD33} supply is dependent on the usage of the pins on all I/O segments. The power consumption is the sum of all input and output pin V_{DD33} currents for all I/O segments. The V_{DD33} current draw on fast speed pads can be calculated from [Table 13](#) dependent on the voltage, frequency, and load on all F type pins. The V_{DD33} current draw on medium pads can be calculated from [Table 13](#) dependent on voltage and independent on the frequency and load on all MH type pins. Use linear scaling to calculate pin currents for voltage, frequency, and load parameters that fall outside the values given in [Table 13](#).

The AC timing of these pads are described in the [Section 5.11.2 Pad AC specifications](#).

¹ All values given are initial design targets and subject to change.² Crystal and External reference frequency limits depend on device relying on PLL to lock prior to release of reset, default PREDIV/EPREDIV, MFD/EMFD default settings, and VCO frequency range. Absolute minimum loop frequency is 4 MHz.³ Upper tolerance of less than 1% is allowed on 40MHz crystal.⁴ “Loss of Reference Frequency” is the reference frequency detected internally, which transitions the PLL into self clocked mode.⁵ Self clocked mode frequency is the frequency that the PLL operates at when the reference frequency falls below f_{LOR} . This frequency is measured at D_CLKOUT. A default RFD value of (0x05) is used in SCM mode, and the programmed MFD and RFD values have no effect

- ⁶ This specification applies to the period required for the PLL to re-lock after changing the MFD frequency control bits in the synthesizer control register (SYNCR). From power up with crystal oscillator reference, lock time will be additive with crystal startup time.
- ⁷ For Flexray operation, duty cycle requirements are higher.
- ⁸ Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{sys} . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the PLL circuitry via V_{DDSYN} and V_{SSSYN} and variation in crystal oscillator frequency increase the C_{jitter} percentage for a given interval. D_CLKOUT divider set to divide-by-2.
- ⁹ Values are with frequency modulation disabled. If frequency modulation is enabled, jitter is the sum of $C_{\text{jitter}} + C_{\text{mod}}$.
- ¹⁰ Modulation depth selected must not result in f_{pll} value greater than the f_{pll} maximum specified value.
- ¹¹ Maximum and minimum variation from programmed modulation depth is pending characterization. Depth settings available in control register are: 2%, 3%, and 4% peak-to-peak.
- ¹² Depth tolerance is the programmed modulation depth $\pm 0.25\%$ of F_{sys} . Violating the VCO min/max range may prevent the system from exiting reset.
- ¹³ Modulation rates less than 400 kHz will result in exceedingly long FM calibration durations. Modulation rates greater than 1 MHz will result in reduced calibration accuracy.
- ¹⁴ Violating this range will cause the VCO max/min range to be violated with the default MFD settings out of reset.

¹ All values given are initial design targets and subject to change.

² This parameter is meant for those who do not use quartz crystals or resonators, but instead use CAN oscillators in crystal mode. In that case, $V_{\text{extal}} - V_{\text{xtal}} \geq 400 \text{ mV}$ criterion has to be met for oscillator's comparator to produce output clock.

³ I_{xtal} is the oscillator bias current out of the XTAL pin with both EXTAL and XTAL pins grounded.

⁴ $C_{\text{PCB_EXTAL}}$ and $C_{\text{PCB_XTAL}}$ are the measured PCB stray capacitances on EXTAL and XTAL, respectively.

¹ Stop mode recovery time is the time from the setting of either of the enable bits in the ADC Control Register to the time that the ADC is ready to perform conversions. Delay from power up to full accuracy = 8 ms.

² At $V_{RH} - V_{RL} = 5.12$ V, one count = 1.25 mV without using pregain.

³ INL and DNL are tested from $V_{RL} + 50$ LSB to $V_{RH} - 50$ LSB. The eQADC is guaranteed to be monotonic at 10 bit accuracy (12 bit resolution selected).

⁴ New design target. Actual specification will change following characterization. Margin for manufacturing has not been fully included.

⁵ At $V_{RH} - V_{RL} = 5.12$ V, one LSB = 1.25 mV.

⁶ The value is valid at 8 MHz, it is ± 8 counts at 16 Mhz.

⁷ Below disruptive current conditions, the channel being stressed has conversion values of \$3FF for analog inputs greater than V_{RH} and \$000 for values less than V_{RL} . Other channels are not affected by non-disruptive conditions.

- ⁸ Exceeding limit may cause conversion error on stressed channels and on unstressed channels. Transitions within the limit do not affect device reliability or cause permanent damage.
- ⁹ Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values using $V_{\text{POSCLAMP}} = V_{\text{DDA}} + 0.5 \text{ V}$ and $V_{\text{NEGCLAMP}} = -0.3 \text{ V}$, then use the larger of the calculated values.
- ¹⁰ Condition applies to two adjacent pins at injection limits.
- ¹¹ Performance expected with production silicon.
- ¹² All channels have same $10 \text{ k}\Omega < R_s < 100 \text{ k}\Omega$ Channel under test has $R_s = 10 \text{ k}\Omega$, $I_{\text{INJ}} = I_{\text{INJMAX}}, I_{\text{INJMIN}}$.
- ¹³ The TUE specification is always less than the sum of the INL, DNL, offset, and gain errors due to cancelling errors.
- ¹⁴ TUE does not apply to differential conversions.
- ¹⁵ Voltages between VRL and VRH will not cause damage to the pins. However, they may not be converted accurately if the differential voltage is above the maximum differential voltage. In addition, conversion errors may occur if the common mode voltage of the differential signal violates the Differential Input common mode voltage specification.

$T_A = T_L \text{ to } T_H$.

Electrical characteristics

- ² Up to the maximum frequency rating of the device (refer to Table 39). The f_{sys} speed is the nominal maximum frequency. 270 Mhz parts allow for 264 Mhz system clock + 2% FM.
- ³ See the *PXR40 Reference Manual* for full description as not all bit combinations are valid.
- ⁴ EBI/Calibration bus is not available in all packages.
- ⁵ The EBI/Calibration Bus operating frequency, $f_{\text{ebi_cal}}$, depends on clock divider settings of block's max allowed frequency of operation. Normally $f_{\text{ebi_cal}} = f_{\text{platf}} / 2$, but can be limited to $< f_{\text{platf}} / 2$ in Full Mode.

8	D_CLKOUT Posedge to Input Signal Invalid (Hold Time) D_ADD[9:30] D_DAT[0:15] D_RD_WR D_TA D_TS	t_{CIH}	1.0	—	ns	
9	D_ALE Pulse Width	t_{APW}	6.5	—	ns	The timing is for Asynchronous external memory system.
10	D_ALE Negated to Address Invalid	t_{AAI}	2.0/1.0 ⁵	—	ns	The timing is for Asynchronous external memory system. ALE is measured at 50% of VDDE.

¹ EBI timing specified at $V_{DD} = 1.08\text{ V to }1.32\text{ V}$, $V_{DDE} = 3.0\text{ V to }3.6\text{ V}$, V_{DD33} and $V_{DDSYN} = 3.0\text{ V to }3.6\text{ V}$, $T_A = T_L$ to T_H , and $C_L = 30\text{ pF}$ with DSC = 0b10.

² Speed is the nominal maximum frequency. Max speed is the maximum speed allowed including frequency modulation (FM). 270 MHz parts allow for 264 MHz system clock + 2% FM.

³ Depending on the internal bus speed, set the SIU_ECCR[EBDF] bits correctly not to exceed maximum external bus frequency. The maximum external bus frequency is 66 MHz.

⁴ Refer to Fast pad timing in Table 28 and Table 29.

⁵ ALE hold time spec is temperature dependant. 1.0 ns spec applies for temperature range -40 to 0 °C. 2.0 ns spec applies to temperatures > 0 °C. This spec has no dependency on SIU_ECCR[EBTS] bit.

² Speed is the nominal maximum frequency of platform clock (f_{platt}). Max speed is the maximum speed allowed including frequency modulation (FM). 270 MHz parts allow for 264 Mhz for system core clock (f_{sys}) + 2% FM.

³ The minimum DSPI Cycle Time restricts the baud rate selection for given system clock rate. These numbers are calculated based on two devices communicating over a DSPI link.

⁴ The actual minimum SCK cycle time is limited by pad performance.

⁵ The maximum value is programmable in DSPI_CTARn[PSSCK] and DSPI_CTARn[CSSCK].

⁶ The maximum value is programmable in DSPI_CTARn[PASC] and DSPI_CTARn[ASC].

⁷ For example, external master should start SCK clock not earlier than 3 system clock periods after assertion SS

⁸ This number is calculated assuming the SMPL_PT bitfield in DSPI_MCR is set to 0b10.

The DSPI in this device can be configured to serialize data to an external device that implements the Microsecond Bus protocol. DSPI pins support 5 V logic levels or Low Voltage Differential Signalling (LVDS) for data and clock signals to improve high speed operation.
