

KAF-1001

1024 (H) x 1024 (V) Full Frame CCD Image Sensor

Description

The KAF-1001 Image Sensor is a high-performance charge-coupled device (CCD) designed for a wide range of image sensing applications.

The sensor incorporates true two-phase CCD technology, simplifying the support circuits required to drive the sensor as well as reducing dark current without compromising charge capacity. The sensor also utilizes the TRUESENSE Transparent Gate Electrode to improve sensitivity compared to the use of a standard front side illuminated polysilicon electrode.

Selectable on-chip output amplifiers allow operation to be optimized for different imaging needs: Low Noise (when using the high-sensitivity output) or Maximum Dynamic Range (when using the low-sensitivity output).

Table 1. GENERAL SPECIFICATIONS

Parameter	Typical Value
Architecture	Full Frame CCD
Pixel Count	1024 (H) x 1024 (V)
Pixel Size	24 μm (H) x 24 μm (V)
Active Image Size	24.6 mm (H) x 24.6 mm (V) 34.8 mm (Diagonal) APS-H Optical Format
Chip Size	28.6 mm (H) x 25.5 mm (V)
Optical Fill-Factor	100%
Saturation Signal High Sensitivity Output High Dynamic Range	240,000 electrons 650,000 electrons
Output Sensitivity High Sensitivity Output High Dynamic Range	11 μV /electron 2 μV /electron
Readout Noise (1 MHz)	15 electrons rms
Dark Current (25°C, Accumulation Mode)	< 30 pA/cm ²
Dark Current Doubling Rate	5–6°C
Dynamic Range (Sat Sig/Dar Noise) High Sensitivity Output High Dynamic Range	83 dB 97 dB
Quantum Efficiency (450, 550, 650 nm)	40%, 55%, 65%
Maximum Data Rate High Sensitivity Output High Dynamic Range	5 MHz 2 MHz
Transfer Efficiency (2 MHz, to -40°C)	> 0.99997
Package	CERDIP Package (Sidebrazed)
Cover Glass	Clear

NOTE: Parameters above are specified at T = 25°C unless otherwise noted.

Figure 1. KAF-1001 CCD Image Sensor

Features

- True Two Phase Full Frame Architecture
- TRUESENSE Transparent Gate Electrode for High Sensitivity
- 100% Fill Factor
- Low Dark Current
- Single Readout Register
- User-selectable Outputs Allow either Low Noise or High Dynamic Range Operation

Applications

- Scientific
- Medical

ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

KAF-1001

DEVICE DESCRIPTION

Architecture

NOTE: Shaded areas represent 4 non-imaging pixels at the beginning and 8 non-imaging pixels at the end of each line. There are also 4 non-imaging lines at the top and bottom of each frame.

Figure 2. Block Diagram

Refer to the block diagram in Figure 2. The KAF-1001 consists of one vertical (parallel) CCD shift register, one horizontal (serial) CCD shift register and a selectable high or low gain output amplifier. Both registers incorporate true two-phase buried channel technology. The vertical register consists of $24\ \mu\text{m} \times 24\ \mu\text{m}$ photo-capacitor sensing elements (pixels) which also serves as the transport mechanism. The pixels are arranged in a $1024\ (\text{H}) \times 1024\ (\text{V})$ array; an additional 12 columns (4 at the left and 8 at the right) and 8 rows (4 each at top and bottom) of non-imaging pixels are added as dark reference. Because there is no storage array, this device must be synchronized with strobe illumination or shuttered during readout.

Output Structure

The final gate of the horizontal register is split into two sections, $\phi\text{H}21$ and $\phi\text{H}22$. The split gate structure allows the

user to select either of the two output amplifiers. To use the high dynamic range single-stage output ($V_{\text{OUT}1}$), tie $\phi\text{H}22$ to a negative voltage to block charge transfer, and tie $\phi\text{H}21$ to $\phi\text{H}2$ to transfer charge. To use the high sensitivity two-stage output ($V_{\text{OUT}2}$), tie $\phi\text{H}21$ to a negative voltage and $\phi\text{H}22$ to $\phi\text{H}2$. The charge packets are then dumped onto the appropriate floating diffusion output node whose potential varies linearly with the quantity of charge in each packet. The amount of potential change is determined by the simple expression $\Delta V_{\text{fd}} = \Delta Q/C_{\text{fd}}$. The translation from electrons to voltages is called the output sensitivity or charge-to-voltage conversion. After the output has been sensed off-chip, the reset clock (ϕR) removes the charge from the floating diffusion via the reset drain (VRD). This, in turn, returns the floating diffusion potential to the reference level determined by the reset drain voltage.

KAF-1001

Figure 3. Output Schematic

Image Acquisition

An image is acquired when incident light, in the form of photons, falls on the array of pixels in the vertical CCD register and creates electron-hole pairs (or simply electrons) within the silicon substrate. This charge is collected locally by the formation of potential wells created at each pixel site by induced voltages on the vertical register clock lines ($\phi V1$, $\phi V2$). These same clock lines are used to implement the transport mechanism as well. The amount of charge collected at each pixel is linearly dependent on light level and exposure time and non-linearly dependent on wavelength until the potential well capacity is exceeded. At this point charge will 'bloom' into vertically adjacent pixels.

Charge Transport

Integrated charge is transported to the output in a two-step process. Rows of charge are first shifted line by line into the horizontal CCD. 'Lines' of charge are then shifted to the output pixel by pixel. Referring to the timing diagram,

integration of charge is performed with $\phi V1$ and $\phi V2$ held low. Transfer to horizontal CCD begins when $\phi V1$ is brought high causing charge from the $\phi V1$ and $\phi V2$ gates to combine under the $\phi V1$ gate.

$\phi V1$ and $\phi V2$ now reverse their polarity causing the charge packets to 'spill' forward under the $\phi V2$ gate of the next pixel. The rising edge of $\phi V2$ also transfers the first line of charge into the horizontal CCD. A second phase transition places the charge packets under the $\phi V1$ electrode of the next pixel. The sequence completes when $\phi V1$ is brought low. Clocking of the vertical register in this way is known as accumulation mode clocking. Next, the horizontal CCD reads out the first line of charge using traditional complementary clocking (using $\phi H1$ and $\phi H2$ pins) as shown. The falling edge of $\phi H2$ forces a charge packet over the output gate (OG) onto one of the output nodes (floating diffusion) which controls the output amplifier. The cycle repeats until all lines are read.

Physical Description

Pin Description and Device Orientation

Figure 4. Pinout Diagram

Table 4. PIN DESCRIPTION

Pin	Name	Description
1	SUB	Substrate
2	$\phi V2$	Vertical (Parallel) CCD Clock – Phase 2
3	$\phi V1$	Vertical (Parallel) CCD Clock – Phase 1
4	SUB	Substrate
5	VOUT2	Video Output from High Sensitivity Two-Stage Amplifier
6	VDD2	High Sensitivity Two-Stage Amplifier Supply
7	VLG	First Stage Load Transistor Gate for Two-Stage Amplifier
8	VSS	Output Amplifier Return
9	ϕR	Reset Clock
10	VRD	Reset Drain
11	VDD1	High Dynamic Range Single-Stage Amplifier Supply
12	VOUT1	Video Output from High Dynamic Range Single-Stage Amplifier
13	VOG	Output Gate

Pin	Name	Description
14	$\phi H21$	Last Horizontal (Serial) CCD Phase – Split Gate
15	$\phi H22$	Last Horizontal (Serial) CCD Phase – Split Gate
16	$\phi H1$	Horizontal (Serial) CCD Clock – Phase 1
17	$\phi H2$	Horizontal (Serial) CCD Clock – Phase 2
18	N/C	No Connection
19	N/C	No Connection
20	N/C	No Connection
21	$\phi V2$	Vertical (Parallel) CCD Clock – Phase 2
22	$\phi V1$	Vertical (Parallel) CCD Clock – Phase 1
23	GUARD	Guard Ring
24	$\phi V1$	Vertical (Parallel) CCD Clock – Phase 1
25	$\phi V2$	Vertical (Parallel) CCD Clock – Phase 2
26	SUB	Substrate

1. Pins 3, 22, and 24 must be connected together – only one Phase 1 clock driver is required.
2. Pins 2, 21, and 25 must be connected together – only one Phase 2 clock driver is required.

IMAGING PERFORMANCE

Typical Operational Conditions

All values derived using nominal operating conditions with the recommended timing. Correlated doubling

sampling of the output is assumed and recommended. Many units are expressed in electrons: to convert to voltage, multiply by the amplifier sensitivity.

- Point where the output saturates when operated with nominal voltages.
- Signal level at the onset of blooming in the vertical (parallel) CCD register.
- Maximum signal level at the output of the high dynamic range output. This signal level will only be achieved when binning pixels containing large signals.
- None of 64 sub arrays (128 × 128) exceed the maximum dark current specification.
- For 2 MHz data rate and T = 30°C to –40°C.
- Using maximum CCD frequency and/or minimum CCD transfer times may compromise performance.
- Time between the rising edge of φV1 and the first falling edge of φH1.
- At T_{INTEGRATION} = 0; data rate = 1 MHz; temperature = –30°C.
- Uses 20LOG (Ne⁻_{SAT} / ne⁻_{TOTAL}) where Ne⁻_{SAT} refers to the amplifier saturation signal.
- A parameter that is measured on every sensor during production testing.
- A parameter that is quantified during the design verification activity.

KAF-1001

TYPICAL PERFORMANCE CURVES

Figure 5. Typical Spectral Response

Figure 5 shows a representative spectral response of front side illuminated transparent gate full frame image sensors. The KAF-1001 with 24 μm pixels has higher response than the 6.8 μm pixel sensor at wavelengths greater than 750 nm because it is constructed on a lower resistivity silicon substrate. The resulting collection volume of each pixel more efficiently collects signal generated deeper within the silicon.

Most of the two phase CCD pixels are designed so that each of the electrodes occupies half of the pixel area. The KAF-1001 was not designed this way but instead is designed with the transparent electrode occupying greater than half the pixel area. This further improves the benefits of the transparent gate.

Figure 6. Dark Current as a Function of Temperature

DEFECT DEFINITIONS

Table 6. SPECIFICATIONS

Grade	Point Defect	Cluster Defect	Column Defect
C1	20	2	0
C2	40	10	2

Point Defects

Dark: A pixel which deviates by more than 20% from neighboring pixels when illuminated to 70% of saturation.

Bright: A pixel whose dark current exceeds 4,500 e⁻/pix/sec at 25°C.

Cluster Defect

A grouping of not more than 5 adjacent point defects.

Column Defect

A grouping point defects along a single column (Dark column).

A column that contains a pixel whose dark current exceeds 150,000 e⁻/pix/sec at 25°C (Bright column).

A column that does not exhibit the minimum charge capacity specification (Low Charge capacity).

A column that loses > 500 electrons when the array is illuminated to a signal level of 2,000 e⁻/pix (Trap like defects).

Neighboring Pixels

The surrounding 128 × 128 pixels or ±64 columns/rows.

Defect Separation

Defects are separated by no less than 3 pixels in any one direction.

Figure 7. Active Pixel Region

Horizontal CCD Clock – Phase 1	$\phi H1$	High	7.8	8.0	8.2	V	
Horizontal CCD Clock – Phase 2	$\phi H2$	Low	-2.2	-2.0	-1.8	V	250 pF, 10 M Ω
Horizontal CCD Clock – Phase 2	$\phi H2$	High	7.8	8.0	8.2	V	$C_{\phi H1-H2} = 200$ nF
Reset Clock	ϕR	Low	2.0	3.0	3.5	V	10 pF, 10 M Ω
Reset Clock	ϕR	High	9.5	10.0	11.0	V	

Description	Symbol	Level	Using the High Gain Output (V_{OUT2})			Using the High Dynamic Range Output (V_{OUT1})			Units	Pin Impedance
			Min.	Nom.	Max.	Min.	Nom.	Max.		
Horizontal Clock – Phase 1	$\phi H21$	Low	-4	$\phi H2$ Low	$\phi H2$ Low	-	$\phi H2$	-	V	10 pF, 10 M Ω
Horizontal Clock – Phase 1	$\phi H21$	High	-4	$\phi H2$ Low	$\phi H2$ Low	-	$\phi H2$	-	V	
Horizontal Clock – Phase 2	$\phi H22$	Low	-	$\phi H2$	-	-	$\phi H2$ Low	$\phi H2$ Low	V	10 pF, 10 M Ω
Horizontal Clock – Phase 2	$\phi H22$	High	-	$\phi H2$	-	-	$\phi H2$ Low	$\phi H2$ Low	V	

1. When using V_{OUT1} , $\phi H21$ is clocked identically with $\phi H2$ while $\phi H22$ is held at a static level. When using V_{OUT2} , $\phi H21$ and $\phi H22$ are exchanged so that $\phi H22$ is identical to $\phi H2$ and $\phi H21$ is held at a static level. The static level should be the same voltage as $\phi H2$ low.
2. The AC and DC operating levels are for room temperature operation. Operation at other temperatures may require adjustments of these voltages. Pins shown with impedances greater than 1 M Ω are expected resistances. These pins are only verified to 1 M Ω .
3. $\phi V1, 2$ capacitances are accumulated gate oxide capacitance, and are an over-estimate of the capacitance.
4. This device is suitable for a wide range of applications requiring a variety of different operating conditions. Consult ON Semiconductor in those situations in which operating conditions meet or exceed minimum or maximum levels.

TIMING

Table 10. REQUIREMENTS AND CHARACTERISTICS

Description	Symbol	Minimum	Nominal	Maximum	Units	Notes
ϕ H1, ϕ H2 Clock Frequency	f_H	–	4	5	MHz	1, 2, 3
ϕ V1, ϕ V2 Clock Frequency	f_V	–	100	125	kHz	1, 2, 3
Pixel Period (1 Count)	t_{PIX}	200	250	–	ns	
ϕ H1, ϕ H2 Setup Time	$t_{\phi HS}$	500	1,000	–	ns	
ϕ V1, ϕ V2 Clock Pulse Width	$t_{\phi V}$	4	5	–	μ s	2
Reset Clock Pulse Width	$t_{\phi R}$	20	60	–	ns	4
Readout Time	$t_{READOUT}$	226	286	–	ms	5
Integration Time	t_{INT}	–	–	–		6
Line Time	t_{LINE}	219	277	–	μ s	7

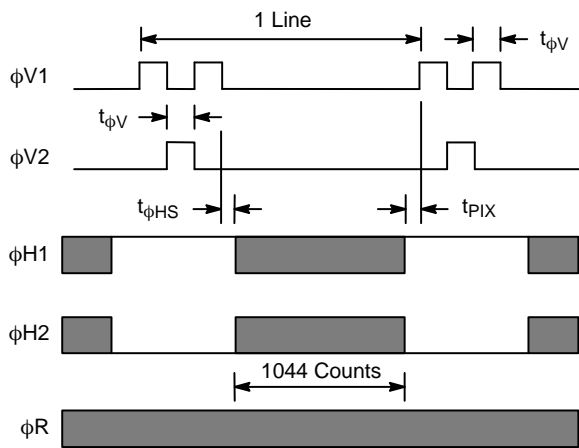

1. 50% duty cycle values.
2. CTE may degrade above the nominal frequency.
3. Rise and fall times (10/90% levels) should be limited to 5–10% of clock period. Crossover of register clocks should be between 40–60% of amplitude.
4. ϕ R should be clocked continuously.
5. $t_{READOUT} = (1032 * t_{LINE})$
6. Integration time (t_{INT}) is user specified. Longer integration times will degrade noise performance due to dark signal fixed pattern and shot noise.
7. $t_{LINE} = (3 * t_{\phi V}) + t_{\phi HS} + (1044 * t_{PIX}) + t_{PIX}$
