### ESD Caution – Handling

Static electricity may be discharged through this disk subsystem. In extreme cases, this may temporarily interrupt the operation or damage components. To prevent this, make sure you are working in an ESD-safe environment. For example, before handling the disk subsystem, touch a grounded device, such as a computer case, prior to handling.

## 1 GENERAL DESCRIPTION

### 1.1 Overview

The SMART Modular mSATA XL+ embedded (internal) SATA module is a robust, solid state drive product. The low power consumption and fast data throughput are major advantages of the SMART Modular mSATA SSD modules over traditional rotating hard disk drives (HDDs).

The mechanical dimensions of the mSATA XL+ products are compatible with both standoff and card guide mounting methods. The mSATA XL+ modules are fully MO-300 compliant.

Utilizing an industry-standard SATA interface and connector, mSATA XL+ modules are easily integrated into a host system without any special BIOS modifications or additional device drivers. These modules are available in capacities of 8 GB to 64 GB.

SMART Modular mSATA XL+ products address the need for enhanced reliability by incorporating on-board error detection and correction with static and dynamic wear leveling algorithms that provide reliable operation over the product life cycle.

### 3 PRODUCT DESCRIPTION

The SMART mSATA XL+ SSD contains a 6 Gb/sec SATA interface controller and a NAND flash controller with corresponding flash memory devices. This system architecture logically and efficiently translates standard SATA HDD commands into flash memory accesses. Parallel access to the flash memory allows overlapped, multi-block access to complete data transfer requests rapidly. Efficient local voltage converters provide the power for logic and memory from the standard SATA power connection using switching regulators to minimize wasted power.

## 7.2 Supported S.M.A.R.T. Operations

Self-monitoring analysis and reporting technology (S.M.A.R.T.) commands provide diagnostic information regarding drive operation and, in certain cases, can assist in predicting drive degradation. Because S.M.A.R.T. alerts the host of possible drive problems, users can assess the situation and back up data prior to an operational failure.

Each S.M.A.R.T. attribute monitors a specific drive condition, with threshold levels configured for select attributes. When the drive exceeds these thresholds, the S.M.A.R.T. attribute reports the condition. In many cases, exceeding the threshold simply indicates you should monitor the drive more closely. Host systems initiate commands, generated manually or with a third-party diagnostic tool, to monitor S.M.A.R.T. attributes.

Although the mSATA supports several S.M.A.R.T. operations, which are subcommands of the S.M.A.R.T. Operations command (see Table 13), the S.M.A.R.T. Return Status and S.M.A.R.T. Read Data subcommands are used for monitoring the drive.

Initiating a S.M.A.R.T. Return Status command returns the current state of the drive, specifying whether or not an attribute exceeded the assigned threshold. If an attribute has exceeded a threshold level, SMART Modular Technologies recommends issuing the S.M.A.R.T. Read Data command to identify the specific attribute (see Table 15).

S.M.A.R.T. commands are issued with B0h in the Command register and the code for the desired operation in the Features register. A S.M.A.R.T. Enable Operations must be issued before any other S.M.A.R.T. command can be performed.
