

Rail-to-rail high output current single operational amplifier

Datasheet – production data

Features

- Rail-to-rail input and output
- Low noise: 9 nV/√Hz
- Low distortion
- High output current: 80 mA (able to drive 32 Ω loads)
- High-speed: 4 MHz, 1 V/μs
- Operating from 2.7 V to 12 V
- ESD internal protection: 1.5 kV
- Latch-up immunity
- Macromodel included in this specification

Applications

- Headphone amplifier
- Piezoelectric speaker driver
- Sound cards, multimedia systems
- Line driver, actuator driver
- Servo amplifier
- Mobile phone and portable communication sets
- Instrumentation with low noise as key factor

1 Description

The TS921 device is a rail-to-rail single BiCMOS operational amplifier optimized and fully specified for 3 V and 5 V operation.

Its high output current allows low load impedances to be driven.

The TS921 device exhibits very low noise, low distortion and low offset. It has a high output current capability which makes this device an excellent choice for high quality, low voltage or battery operated audio systems.

The device is stable for capacitive loads up to 500 pF.

2 Absolute maximum ratings

- All voltage values, except differential voltage are with respect to network ground terminal.
- Differential voltages are the non-inverting input terminal with respect to the inverting input terminal. If $V_{id} > \pm 1$ V, the maximum input current must not exceed ± 1 mA. In this case ($V_{id} > \pm 1$ V) an input serie resistor must be added to limit input current.
- Human body model, 100 pF discharged through a 1.5 k Ω resistor into pin of device.
- Machine model ESD, a 200 pF cap is charged to the specified voltage, then discharged directly into the IC with no external series resistor (internal resistor < 5 Ω), into pin to pin of device.
- There is no short-circuit protection inside the device: short-circuits from the output to V_{CC} can cause excessive heating. The maximum output current is approximately 80 mA, independent of the magnitude of V_{CC} . Destructive dissipation can result from simultaneous short-circuits on all amplifiers.

4 Macromodel

4.1 Important note concerning this macromodel

Please consider following remarks before using this macromodel:

- All models are a trade-off between accuracy and complexity (i.e. simulation time).
- Macromodels are not a substitute to breadboarding; rather, they confirm the validity of a design approach and help to select surrounding component values.
- A macromodel emulates the NOMINAL performance of a TYPICAL device within SPECIFIED OPERATING CONDITIONS (i.e. temperature, supply voltage, etc.). Thus the macromodel is often not as exhaustive as the datasheet, its goal is to illustrate the main parameters of the product.
- Data issued from macromodels used outside of its specified conditions (V_{CC} , temperature, etc.) or even worse: outside of the device operating conditions (V_{CC} , V_{icm} , etc.) are not reliable in any way.

In [Section 4.3](#), the electrical characteristics resulting from the use of these macromodels are presented.

4.2 Electrical characteristics from macromodelization

| Dec. 2004 | 2 | Modifications on AMR table page 2 (explanation of V_{id} and V_i limits, ESD, MM and CDM values added, Rthja added) |
| Nov. 2005 | 3 | The following changes were made in this revision: PPAP references inserted in the datasheet see Table 1 . Data in tables Electrical characteristics on page 4 reformatted for easier use. Thermal Resistance Junction to Case added in Table 2 on page 3 . |
| 19-Sep-2012 | 4 | Updated Figure on page 1(replaced V_{CC-} by V_{DD}). Updated (renamed) Table 1 , removed TS921IYD/IYDT devices from Table 1 . Moved Description to page 2. Updated Figure 1 to Figure 4 , Figure 6 to Figure 12 (added conditions to titles). Updated ECOPACK text and reformatted Section 5 (added Table 7 to Table 9 , reversed order of figures and tables). Minor corrections throughout document. |
