Transformers for Switching Power Supplies

Pin terminal type (For multiple outputs)

ECO series

- ECO20 (Vertical/Horizontal types)
- ECO22 (Vertical/Horizontal types)
- ECO24 (Vertical/Horizontal types)

An attention matter on use

Please read this specifications before using this product by all means.

An attention matter on security

I undertake use with this product, and it is paid attention enough, and please design an attention matter safely.

▲ Attention on a design

○ When you designs a base of an electric circuit.

Please use size of the hole or pad which we recommend.

 \bigcirc Magnetic flux to leak out occurs. Please confirm it about influence of magnetic flux beforehand.

There is fear to cause false movement of machinery.

 \bigcirc In a design of a base of an electric circuit, Please consider the next contents.

In an applied safe standard.

The trans and distance with other parts

The product is not quakeproof structure. Accordingly please do not add vibration and a shock to it. There is fear to lose a function.

Attention on the handling

Please do not use it when you let a product drop. The product produces possibility to lose a function

O Please pay attention to the pin which had it pointed keenly.

There is danger to injure.

- Please avoid the next place. The place that receives a drop of water, trash, the dust, foggy influence. The place where direct rays of the sun hits. There is fear to cause false movement of machinery.
- Please prohibit safekeeping and use at the next place. Environment to be accompanied with gas corrosion, salt, acid, alkali. There is fear to lose a function.

When you carry the product on a base of an electric circuit. Please do not use a metal tool. Because impossible power is added to a product. There is fear to lose a function.

Attention

○ I considered the next matter, and we designed a product.

Safe standard and power supply voltage and circuit drive condition, drive frequency and Duty ON-TIME.

By those conditions, we decided structure and the turns number.

Please avoid use in designed condition outside.

There are destruction of a circuit part and fear of ignition.

◯ This product considered a characteristic of a component and a self temperature rise, and it was made.

We select range of humidity as use temperature already.

Please avoid use by range more than this.

There are the damage and fear of ignition.

Please avoid use in the environment next.

The environment that trash and the dust stick to a product. There is fear to cause a fire.

The products listed on this specification sheet are intended for use in general electronic equipment (AV equipment, telecommunications equipment, home appliances, amusement equipment, computer equipment, personal equipment, office equipment, measurement equipment, industrial robots) under a normal operation and use condition.

O The products are not designed or warranted to meet the requirements of the applications listed below, whose performance and/or quality require a more stringent level of safety or reliability, or whose failure, malfunction or trouble could cause serious damage to society, person or property.

If you intend to use the products in the applications listed below or if you have special requirements exceeding the range or conditions set forth in this catalog, please contact us.

(1) Aerospace/Aviation equipment

(2)Transportation equipment (cars, electric trains, ships, etc.)

(3) Medical equipment

- (4) Power-generation control equipment
- (5) Atomic energy-related equipment

(6) Seabed equipmentapplications

(7) Transportation control equipment

- (8) Public information-processing equipment
- (9) Military equipment
- (10) Electric heating apparatus, burning equipment
- (11) Disaster prevention/crime prevention equipment
- (12) Safety equipment
- (13) Other applications that are not considered general-purpose applications

When designing your equipment even for general-purpose applications, you are kindly requested to take into consideration securing protection circuit/device or providing backup circuits in your equipment.

Pin terminal type (For multiple outputs)

&TDK

Product compatible with RoHS directive Compatible with lead-free solders

Development Concept of the ECO Series

The ECO series is compliant with worldwide safety standards*. It is a pin-compatible, newly developed transformer that can be downsized and thinned.

* Applicable as of April 2007: UL/IEC/J 60065 Ver.7 (TV, DVD, STB), UL/IEC/60950 Ver.3 (printer), UL/IEC 60335-1 Ver.4 (home appliance)

MATERIAL

Optimum materials and core shape have been developed. No insulation-supporting material is used, and this secures the insulating distance.

While optimizing materials, TDK has further improved its proprietary core shape to develop a new-type ECO core. TDK has downsized the product considerably in order to securing the necessary creepage distance.

MANUFACTURING METHOD

Since the ECO Series supports automatic winding, the product is of a high quality and can be manufactured stably.

It is designed to support automatic winding, which enables a remarkable reduction in the loss generated to achieve a proficient in manual winding until stable production.

OPTIMIZATION DESIGN

Using design tools developed with TDK's comprehensive know-how, high-precision design has been achieved in a short period of time.

- 1) For optimization design and high-quality stable production, customers can use a specification request form.
- 2) If you provide the necessary information in the form, you will receive the optimization design in a short time.
- 3) We have prepared an individual specifications request document for the home appliance market.
- 4) TDK recommends design with a standard core gap (AL-value) for optimization and shorter trial and mass production lead time.Plans for standard winding connection (patterns of recommended pin arrangement and winding structure) are available.These help to speed up the design process, support automatic winding, and prevent deterioration in quality.

ENVIRONMENT

The ECO series is RoHS directive-compliant.

(5/34)

Transformers for Switching Power Supplies Pin terminal type (For multiple outputs) Product compatible with RoHS directive Compatible with lead-free solders

Overview of the ECO Series

FEATURES

- O Downsized yet compliant with worldwide safety standards.
- Supports automatic winding.
- O Considerably reduced characteristic variations.
- O Product compatible with RoHS directive.

APPLICATION

- O Set-top boxes, air-conditioners, DVD players/recorders
- O Blu-ray disc players/recorders, printers, LCD monitors
- O Multiple-output power supplies

* With self-heating

** Maximum wet-bulb temperature 38°C, without dewing

***Without dewing

O RoHS Directive Compliant Product: See the following for more details related to RoHS Directive compliant products. http://www.tdk.co.jp/rohs/

(6/34)

Overview of the ECO Series

GENERAL CHARACTERISTICS

Item	Standards	Test methods
Inductance	Individual specification (tolerance±10%)	Use LCR meter (f=10kHz), 4263B or equivalent.
DC resistance	Less than 0.1Ω: ±30% 0.1Ω to 1.0Ω: ±20% 1.0Ω or more: ±15%	Use Ohm-meter AX114N or equivalent.
Turn ratio and polarity	Specified value ±1 to 20%, individual specification	Use turn ratio tester TRM-201 (f=1 to 100kHz) or equivalent.
Withstand voltage	No abnormality between the primary and secondary windings, between the primary winding and the core, and so on.	Apply separately specified AC voltage (50Hz) for 1min.
Insulation resistance	100M Ω min.	Measure by applying DC.500V. Use insulation resistance meter SM-5E or equivalent.
Temperature rise	Standard design value 45°C max. (thermocouple method) 55°C max. (resistance method)	Measure the core surface by thermocouple method, and the windings by resistance method or thermocouple method.

RELIABILITY TESTS

Item	Standards	Test methods
Vibration resistance		Sweep 1.5mm amplitude and 10-to-55-to-10Hz in 1min in X, Y, and Z directions for 2h respectively.
Heat resistance	Standard of inductance, insulation	Measure in normal temperature after leaving in 100±2°C for 96h.
Cold resistance	resistance, withstand voltage must be	Measure in normal temperature after leaving in -40±2°C for 96h.
Humidity resistance	satisfied.	Measure in normal temperature after leaving in 60±2°C and 90 to 95(%)RH for 96h.
Temperature cycle		One cycle is –25°C for 30min, normal temperature for 30min, and 85°C for 30min; measure after 10 cycles of the test have been performed.
Terminal strength	9.8N min.	Apply 9.8N load in the direction of terminal axis for 30±5s. Any terminal must not be pulled out or chatter.
Solderability	Solder covers more than 90%.	Dip in solder with the temperature of 245±2°C for 3±0.5s.

The above listed items are representative examples. The details can be found by referring to the appended individual delivery specifications.

*1 Ferrite cores are not sold separately.

*² The reference output was obtained under conditions where the frequency was 50kHz and creepage distance was 4mm. (See the relevant page for details of each shape.) The reference output differs depending on the switching device, switching frequency, transformer temperature, conditions, etc. Use this output for reference.

*3 The bobbin is made from phenol with a flame resistance grade of 94V-2 or higher.

Design Reference for Switching Power Transformers

· Maximum allowable temperature

The maximum ambient temperature of the transformer is E Class (120°C).

However, there is no E Class for transformers shipped for North America; therefore, the maximum ambient temperature is Class 105 (105°C). [Class 130 (130°C) is possible when UL1446 insulating system is applied.]

• Temperature rise in Transformers

In normal design condition, 55°C or less (using the resistance method) is the target of temperature rise of windings. Therefore, the maximum ambient temperature at this time is 65°C (50°C max. for North America).

In case of measuring the temperature of the windings by thermocouple, 10 to 15° C more would be allowable.

· Dealing with safety regulations

Designs are made in consideration of materials, structures an so on that the designed transformers are comply with designated safety regulations.

(1)Regarding the core

To be handled in the same manner as Basic Insulation. (2)Distance between transformer and other parts

Please keep the distance between the transformer and other parts in according with applicable safety standards.

· Concerning of the influence of leakage flux

Due to the fact that there is always some degree of leakage flux from transformer, designs should be made to keep them apart as much as possible from parts that are easily affected by this.

Magnetic saturation of the core

- (1)Magnetic operating condition of the core in the transformer are determined by maximum operation temperature (including temperature rise) and driving condition in circuits. If product is used in condition that exceed these conditions, there is a possibility of occurring magnetic saturation of the core. The following items could be possible cause of core saturation.
 - The product is used in conditions that exceed the maximum operating temperature.
 - Operating frequencies are lower than the ones initially designed. (longer ON time)
 - The input voltage is abnormally higher than the specified values.

(2)To check on the saturation of the core it is possible to judge from current waveforms of primary winding. Current flowing in the inductor changes in a straight line in relation to time as in the figure a) in accordance with

$$=\frac{E}{L} \times T.$$

However, in the event that a saturation phenomena has occurred in the core, inductance is reduced causing a rapid and drastic increase of current as shown figure b).

(3)In this case, there is possibility that a breakdown may occur due to surpassing the rated current of the switch it is necessary to have over current protection circuit or modify transformer design.

· Circuit topologies of switching power supply

The term "topology" refers to the arrangement of the power components within the switching power supply design. There are several different kind of circuit topologies as following;

Γ	- Forward converter
ON/ON mode	-Push-Pull converter
	-Half and Full-Bridge converter
	 Self-excited flyback system (RCC system, pseudo resonance system)
ON/OFF mode	 Separately-excited flyback system (PWM system, PFM system)
	Chopper type (step-down type, step-up type, step-up/ step-down type)
Resonance mode —	 Voltage resonance type, current resonance type

TRANSFORMERS

· Which topology of switching power supply to use?

Each topology has its relative merit in terms of cost and performance. One topology may have a low parts cost but only be able to provide a limited amount of power; another may have ample power capability but cost more, and so on.

The following relationship between output voltage and power give us one suggestion when we need to chose topology in given conditions;

• The deference of power conversion between Forward and Flyback modes.

Since the forward mode converter is a system that performs power transmission to the output side during ON period of switching transistor, it is possible to work with the large output current. Consequently, forward converter method is suitable to large current output with relatively lower output voltage.

To the contrary, Flyback mode converter is a system that input power is stored within the Inductor or primary coil in the transformer as a magnetic energy during ON period of switching transistor and the stored energy transmit to output side during OFF period of switching transistor. Accordingly, Flyback mode converter is suitable to high voltage and low current output, and does not suite to large current output.

• The stored energy within the inductor.

Energy stored in the inductor Lp is $W = \frac{1}{2} \times L_{P} \times I_{P}^{2} \times [J]$

when lp is a triangular wave, and electric power (energy per unit time) is

$$\mathsf{P} = \frac{[\mathsf{J}]}{[\mathsf{S}]} = \frac{1}{2} \times \mathsf{LP} \times \mathsf{IP}^2 \times \mathsf{f}[\mathsf{W}]$$

Where, Lp: Inductance of primary winding Ip: Peak value of primary current f: Switching frequency

• All specifications are subject to change without notice.

• How to decide primary inductance (Lp)?

(1) When the self-excited flyback system is selected:

Using the formula $P = \frac{1}{2} \times L_P \times I_P^2 \times f[W]$,

it is possible to calculate the inductance value needed for the desired output P under the fixed Ip value. By deriving $E \times Ton = LP \times i$ from the formula

$$E = LP \times \frac{dI}{dt}$$
,

the current which flows through the inductor becomes $i = \frac{E \times Ton}{I P}$

By substituting this with P=, the formula of

$$P = \frac{1}{2} \times L_{P} \times \left(\frac{E \times T_{OP}}{L_{P}}\right)^{2} \times f = \frac{1}{2} \times \frac{E^{2} \times T_{OP}^{2}}{L_{P}} \times f \text{ results}$$

From this, the formula $L_{P} = \frac{E^2 \times T_{OP}^2}{2 \times P} \times f$ results.

Where, E: Input voltage Ton: On time F: Switching frequency

In actual designs this value is to be slightly lowered in consideration of the transformer's efficiency.

(2) When the separately-excited flyback system is selected: The coefficient k is added because a direct current is superimposed on the primary current waveform.

$$L_{P} = \frac{E^{2} \times T_{on^{2}}}{2 \times P} \times f \times \frac{(1+k)}{(1-k)}$$

The primary current waveforms The self-excited flyback system(RCC)

The separately-excited flyback system

TRANSFORMERS

· How to decide number of turns of primary winding?

 $N_{P} = \frac{E \min \times T_{on} \max}{\Delta B \times A \times (1-k)}$

Where,

E min.: Lower limit value of input voltage (Vdc)

A: Core cross section area (m²)

D: Duty ratio

Ton max.: The maximum ON time for switching transistor (sec.) Δ : Operating flux density (T)

(1) When the self-excited flyback system is selected:

$$NP = \frac{E \text{ min.} \times \text{Ton max.}}{\Delta B \times A} (\text{Ton max.} = \frac{D}{f})$$

(2) When the separately-excited flyback system is selected:

$$NP = \frac{E \min.\times Ton \max.}{\Delta B \times A \times (1-k)}$$

Precautions must be taken as the upper limit value of ΔB changes according to core materials, operating temperatures, frequencies, etc.

• Determining of secondary winding

ON-OFF mode

As it is necessary to consider the voltage drop of the rectifier diode on the secondary side,

$$NS = NP \times \frac{V_{O} + VF}{E \text{ min.}} \times \frac{1 - D}{D}$$

Where,

Vf: Voltage drop of the rectifier diode Vo : Output voltage

$$\frac{\text{Ton max.}}{1/\text{f}} = \text{D} : \text{Duty ratio}$$

• Example of drive waveforms

(1) When the self-excited flyback system is selected (RCC)

(2) When the separately-excited flyback system is selected

In order for designing the transformer, the following conditions are necessary.

It is greatly appreciated customer give us those conditions by filling out required information with the appended "Transformer specifications / inquiry form".

(1)Circuit topology

Flyback system, forward system, etc.

(2) Used IC

Design with a high degree of perfection is possible when IC manufacturer and model number information are provided.

(3)Input voltage range

The lower limit of rectified voltage is important, in particular.

(4) Operating frequency (fixed/variable)

It is especially necessary to determine the lower limit frequency for the maximum load condition in Flyback converter.

(5) Maximum duty ratio

It is necessary to specify maximum ON time when input voltage is lower limit, approximately 45% should be the maximum for external excitation system.

(6)Operating temperature range, maximum temperature rise

This is the allowable temperature rise in the transformer, should be equal to the value that ambient temperature has been taken from the temperature index of the materials which is 120°C(105°C in UL system).

(7)Required safety regulations

Structures and materials are chosen to comply with required safety regulations.

(8)Output voltage/current

Required for determination of the winding ratios and wire gage.

(9) Transformer outside dimension

It is necessary for determining the shape.

(10)Instructions concerning circuit designs and pin configuration of transformer

Type of the secondary rectifier diode is important in particular because of voltage drop between First recovery and Schottky barrier type is different, it will affect to design of number of turns of transformer.
