DESCRIPTION

ZD20CF Series Relays have optical isolation between relay input and output. Loads may be connected to either the positive or negative output terminals. ZD20CF Relays act as electronic circuit breakers that sense shorted loads or other overload events and then trip-off. Relay contacts open and no current flows through the relay and associated loads. These relays prevent overcurrent damage to the system. Cycling the relay on-off removes the tripped or latched-off condition and returns the relay to the normal operating state.

NOTES:

1. The ZD20CF relay's input current should be limited to between 8 and 20mA. An external resistor whose value = $(V_{IN} - 2.5 \text{ volts}) \div 0.012$ Amps is a good choice for limiting input current.
2. Relay input transitions should be less than 1.0 millisecond.
3. Loads may be attached to either the positive or negative output terminal.
4. Maximum load current ratings are with the relay in free air and soldered to a printed circuit board.
5. Timing is measured from the input current transition to the 10% or 90% points on the output voltage transition.
6. Overload conditions (including shorted loads) are specified for load supply voltages to 33 Vdc maximum.
7. For through-hole-PCB-solder-attaching ZD20CF series relays, the wave-solder or solder pot operations are limited to +260°C maximum for 10 seconds, maximum.
8. For surface-mount-solder-attaching SZD20CF series relays, in IR heating or convection heating systems, the component temperature is limited to +235°C maximum for 10 seconds maximum.
