## General Description

TS432 series is a three-terminal adjustable shunt regulator with specified thermal stability. The output voltage may be set to any value between  $V_{REF}$  (approximately 1.24V) and 18V with two external resistors. TS432 series has a typical output impedance of  $0.05\Omega$ . Active output circuitry provides a very sharp turn-on characteristic, making TS432 series excellent replacement for zener diode in many applications.

## Features

- Precision Reference Voltage
  - TS432A –  $1.24V \pm 1\%$
  - TS432B –  $1.24V \pm 0.5\%$
- Minimum Cathode Current for Regulation:  $20\mu A$ (typ.)
- Equivalent Full Range Temp. Coefficient:  $50\text{ppm}/^\circ\text{C}$
- Programmable Output Voltage up to 18V
- Fast Turn-On Response
- Sink Current Capability of  $80\mu A$  to 100mA
- Low Dynamic Output Impedance:  $0.05\Omega$
- Low Output Noise
- Halogen Free Available

## Applications

- Voltage Monitor
- Delay Timmer
- Constant –Current Source/Sink
- High-Current Shunt Regulator
- Crow Bar
- Over-Voltage / Under-Voltage Protection

\* The deviation parameters  $\Delta V_{REF}$  and  $\Delta I_{REF}$  are defined as difference between the maximum value and minimum value

obtained over the full operating ambient temperature range that applied.

\* The average temperature coefficient of the reference input voltage,  $\alpha V_{REF}$  is defined as:

$$\alpha V_{ref} \left( \frac{\text{ppm}}{^\circ\text{C}} \right) = \frac{\left( \frac{\Delta V_{ref}}{V_{ref}} \right) \times 10^6}{\Delta T_A} \quad \left( T_A = 25^\circ\text{C} \right)$$

Where:  $T_2-T_1$  = full temperature change.

$\alpha V_{REF}$  can be positive or negative depending on whether  $V_{REF}$  Min. or  $V_{REF}$  Max occurs at the lower ambient temperature. Example:  $\Delta V_{REF}=7.2\text{mV}$  and the slope is positive,  $V_{REF}=1.241\text{V}$  at  $25^\circ\text{C}$ ,  $\Delta T=125^\circ\text{C}$

$$\alpha V_{ref} \left( \frac{\text{ppm}}{^\circ\text{C}} \right) = \frac{0.0072 \times 10^6}{125} = 46 \text{ ppm}/^\circ\text{C}$$

\* The dynamic impedance  $Z_{KA}$  is defined as:

$$|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_K}$$

\* When the device operating with two external resistors,  $R_1$  and  $R_2$ , (refer to Figure 2) the total dynamic impedance of

the circuit is given by:

$$|Z_{KA}'| = |Z_{KA}| \times \left( 1 + \frac{R_1}{R_2} \right)$$

**Additional Information – Stability**

When TS432 series is used as a shunt regulator, there are two options for selection of  $C_L$ , are recommended for optional stability:

- A) No load capacitance across the device, decouple at the load.
- B) Large capacitance across the device, optional decoupling at the load.

The reason for this is that TS432 series exhibits instability with capacitances in the range of 10nF to 1μF (approx.) at light cathode current up to 3mA(typ). The device is less stable the lower the cathode voltage has been set for. Therefore while the device will be perfectly stable operating at a cathode current of 10mA (approx.) with a 0.1μF capacitor across it, it will oscillate transiently during start up as the cathode current passes through the instability region. Select a very low capacitance, or alternatively a high capacitance (10μF) will avoid this issue altogether. Since the user will probably wish to have local decoupling at the load anyway, the most cost effective method is to use no capacitance at all directly across the device. PCB trace/via resistance and inductance prevent the local load decoupling from causing the oscillation during the transient start up phase.

Note: if the TS432 series is located right at the load, so the load decoupling capacitor is directly across it, then this capacitor will have to be  $\leq 1\text{nF}$  or  $\geq 10\mu\text{F}$ .

**Applications Examples**

L.E.D. indicator is 'ON' when  $V_{in}$  is between the upper and lower limits,

$$\text{Lower limit} = \left( 1 + \frac{R1}{R2} \right) V_{ref}$$

$$\text{Upper limit} = \left( 1 + \frac{R3}{R4} \right) V_{ref}$$

**Figure 4: Voltage Monitor**

$$V_{out} = \left( 1 + \frac{R1}{R2} \right) V_{ref}$$

$$V_{out(min)} = V_{ref} + 5.0 \text{ V}$$

The areas under the curves represent conditions that may cause the device to oscillate. For curves B, C, and D,  $R_2$  and  $V_+$  were adjusted to establish the initial  $V_{KA}$  and  $I_{KA}$  conditions with  $C_L=0$ .  $V_{BATT}$  and  $C_L$  then were adjusted to determine the ranges of stability.
