## Reverse avalanche capability

In operation with an antiparallel freewheeling diode, the GTO reverse voltage $\mathrm{V}_{\mathrm{R}}$ may exceed the rate value $\mathrm{V}_{\text {RRM }}$ due to stray inductance and diode turn-on voltage spike at high di/dt. The GTO is then driven into reverse avalanche. This condition is not dangerous for the GTO provided avalanche time and current are below $10 \mu \mathrm{~s}$ and 1000 A respectively. However, gate voltage must remain negative during this time. Recommendation : $\mathrm{V}_{\mathrm{GR}}=10 \ldots 15 \mathrm{~V}$.
