

■ FEATURES

- Ultra Low Supply Current 1 μ A(typ.)
- Guaranteed Reset Valid to Vcc=0.9V
- Available in Three Output Type: Open-Drain Active Low (AIC809N), Push-Pull Active Low (AIC809), Push-Pull Active High (AIC810)
- 140ms Min. Power-On Reset Pulse Width
- Internally Fixed Threshold 2.3V, 2.6V, 2.9V, 3.1V, 4.0V, 4.2V, 4.4V, 4.6V
- Tight Voltage Threshold Tolerance: 1.5%
- Tiny Package in SOT-23

■ APPLICATIONS

- Notebook Computers
- Digital Still Cameras
- PDAs
- Critical Microprocessor Monitoring

■ DESCRIPTION

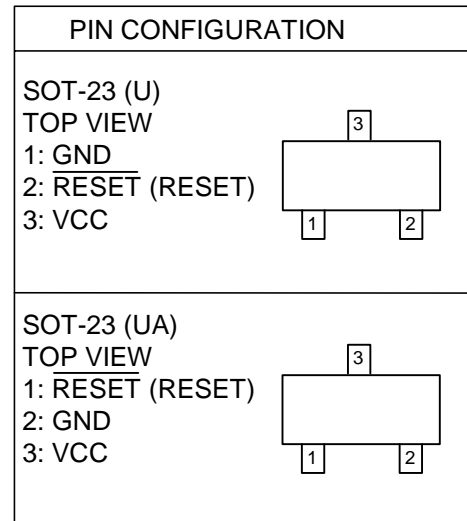

AIC809/AIC810 are low-power microprocessor (μ P) supervisory circuits used to monitor power supplies in μ P and digital systems. They provide applications with benefits of circuit reliability and low cost by eliminating external components.

These devices perform as valid signals in applications with Vcc ranging from 6.0V down to 0.9V. The reset signal lasts for a minimum period of 140ms whenever VCC supply voltage falls below preset threshold. Both AIC809 and AIC810 were designed with a reset comparator to help identify invalid signals, which last less than 140ms. The only difference between them is that they have an active-low $\overline{\text{RESET}}$ output and active-high RESET output, respectively.

Low supply current (1 μ A) makes AIC809/AIC810 ideal for portable equipment. The devices are available in SOT-23 package.

■ TYPICAL APPLICATION CIRCUIT

ORDERING INFORMATION

(Additional voltage versions with a unit of 0.1V within the voltage range from 1.5V to 5.5V for this product line may be available on demand with prior consultation with AIC.)

■ PIN DESCRIPTIONS

GND Pin : Ground.

$\overline{\text{RESET}}$ Pin (AIC809) : Active low output pin. $\overline{\text{RESET}}$ Output remains low while Vcc is below the reset threshold.

RESET Pin (AIC810) : Active high output pin. RESET output remains high while Vcc is below the reset threshold.

Vcc Pin : Supply voltage.

■ DETAIL DESCRIPTIONS OF TECHNICAL TERMS

RESET OUTPUT

μ P will be activated at a valid reset state. These μ P supervisory circuits assert reset to prevent code execution errors during power-up, power-down, or brownout conditions.

$\overline{\text{RESET}}$ is guaranteed to be a logic low for $V_{\text{TH}} > V_{\text{CC}} > 0.9\text{V}$. Once VCC exceeds the reset threshold, an internal timer keeps $\overline{\text{RESET}}$ low for the reset timeout period; after this interval, $\overline{\text{RESET}}$ goes high.

If a brownout condition occurs (VCC drops below the reset threshold), $\overline{\text{RESET}}$ goes low. Any time VCC goes below the reset threshold, the internal timer resets to zero, and $\overline{\text{RESET}}$ goes low. The

internal timer is activated after VCC returns above the reset threshold, and $\overline{\text{RESET}}$ remains low for the reset timeout period.

BENEFITS OF HIGHLY ACCURATE RESET THRESHOLD

AIC809/810 with specified voltage as $5\text{V} \pm 10\%$ or $3\text{V} \pm 10\%$ are ideal for systems using a $5\text{V} \pm 5\%$ or $3\text{V} \pm 5\%$ power supply. The reset is guaranteed to assert after the power supply falls out of regulation, but before power drops below the minimum specified operating voltage range of the system ICs. The pre-trimmed thresholds are reducing the range over which an undesirable reset may occur.

■ APPLICATION INFORMATION

NEGATIVE-GOING VCC TRANSIENTS

In addition to issuing a reset to the μ P during power-up, power-down, and brownout conditions, AIC809 series are relatively resistant to short-duration negative-going VCC transient.

ENSURING A VALID RESET OUTPUT DOWN TO VCC=0

When VCC falls below 0.9V, AIC809 $\overline{\text{RESET}}$ output no longer sinks current; it becomes an open circuit. In this case, high-impedance CMOS logic inputs connecting to $\overline{\text{RESET}}$ can drift to undetermined voltages. Therefore, AIC809/810 with CMOS is perfect for most applications of VCC

below 0.9V. However in applications where $\overline{\text{RESET}}$ must be valid down to 0V, adding a pull-down resistor to $\overline{\text{RESET}}$ causes any leakage currents to flow to ground, holding $\overline{\text{RESET}}$ low.

INTERFACING TO μ P WITH BIDIRECTIONAL RESET PINS

The $\overline{\text{RESET}}$ output on the AIC809N is open drain, this device interfaces easily with μ Ps that have bidirectional reset pins. Connecting the μ P supervisor's $\overline{\text{RESET}}$ output directly to the microcontroller's $\overline{\text{RESET}}$ pin with a single pull-up resistor allows either device to assert reset.
