## Features

- Industrial and commercial temperature
- Organization: 32,768 words $\times 16$ bits
- Center power and ground pins
- High speed
- 10/12/15/20 ns address access time
- 5, 6, 7, 8 ns output enable access time
- Low power consumption: ACTIVE
- $605 \mathrm{~mW} /$ max @ 10 ns
- Low power consumption: STANDBY
- $55 \mathrm{~mW} /$ max CMOS I/O
- 6T 0.18u CMOS Technology

## Logic block diagram

- Easy memory expansion with $\overline{\mathrm{CE}}, \overline{\mathrm{OE}}$ inputs
- TTL-compatible, three-state I/O
- 44-pin JEDEC standard package
- 400 mil SOJ
- 400 mil TSOP 2
- ESD protection $\geq 2000$ volts
- Latch-up current $\geq 200 \mathrm{~mA}$

## Pin arrangement

44-Pin SOJ, TSOP 2 (400 mil)

## Selection guide

| Maximum CMOS standby current | 10 | 10 | 10 | 10 | mA |

## Functional description

The AS7C513B is a high performance CMOS 524,288-bit Static Random Access Memory (SRAM) device organized as 32,768 words $\times 16$ bits. They are designed for memory applications where fast data access, low power, and simple interfacing are desired.

Equal address access and cycle times ( $\mathrm{t}_{\mathrm{AA}}, \mathrm{t}_{\mathrm{RC}}, \mathrm{t}_{\mathrm{WC}}$ ) of $10 / 12 / 15 / 20 \mathrm{~ns}$ with output enable access times ( $\mathrm{t}_{\mathrm{OE}}$ ) of $5,6,7,8 \mathrm{~ns}$ are ideal for high performance applications. The chip enable input CE permits easy memory expansion with multiple-bank memory systems.
When $\overline{\mathrm{CE}}$ is high, the device enters standby mode. If inputs are still toggling, the device consumes $\mathrm{I}_{\mathrm{SB}}$ power. If the bus is static, then the full standby power is reached ( $\mathrm{I}_{\mathrm{SB} 1}$ ). The AS7C513B is guaranteed not to exceed 55 mW power consumption under nominal full standby conditions.

A write cycle is accomplished by asserting write enable ( $\overline{\mathrm{WE}}),(\overline{\mathrm{UB}})$ and/or ( $\overline{\mathrm{LB}}$ ), and chip enable $(\overline{\mathrm{CE}})$. Data on the input pins I/O0 - I/O7, and/or I/O8 - I/O15, is written on the rising edge of $\overline{\mathrm{WE}}$ (write cycle 1) or $\overline{\mathrm{CE}}$ (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ( $\overline{\mathrm{OE}}$ ) or write enable ( $\overline{\mathrm{WE}}$ ).
A read cycle is accomplished by asserting output enable $(\overline{\mathrm{OE}}),(\overline{\mathrm{UB}})$ and $(\overline{\mathrm{LB}})$, and chip enable $(\overline{\mathrm{CE}})$, with write enable $(\overline{\mathrm{WE}})$ high. The chips drive I/O pins with the data word referenced by the input address. When either chip enable or output enable is inactive, or write enable is active, or ( $\overline{\mathrm{UB}}$ ) and ( $\overline{\mathrm{LB}}$ ), output drivers stay in high-impedance mode.
The devices provide multiple center power and ground pins, and separate byte enable controls, allowing individual bytes to be written and read. $\overline{\mathrm{LB}}$ controls the lower bits, I/O0 - I/O7, and $\overline{\mathrm{UB}}$ controls the higher bits, I/O8 - I/O15.

All chip inputs and outputs are TTL-compatible. The AS7C513B is packaged in common industry standard packages.

## Absolute maximum ratings

| Parameter | Symbol | Min | Max | Unit |
| :--- | :---: | :---: | :---: | :---: |
| Voltage on $\mathrm{V}_{\mathrm{CC}}$ relative to GND | $\mathrm{V}_{\mathrm{t} 1}$ | -0.50 | +7.0 | V |
| Voltage on any pin relative to GND | $\mathrm{V}_{\mathrm{t} 2}$ | -0.50 | $\mathrm{~V}_{\mathrm{CC}}+0.50$ | V |
| Power dissipation | $\mathrm{P}_{\mathrm{D}}$ | - | 1.0 | W |
| Storage temperature (plastic) | $\mathrm{T}_{\text {stg }}$ | -65 | +150 | ${ }^{\circ} \mathrm{C}$ |
| Ambient temperature with $\mathrm{V}_{\mathrm{CC}}$ applied | $\mathrm{T}_{\text {bias }}$ | -55 | +125 | ${ }^{\circ} \mathrm{C}$ |
| DC current into outputs (low) | $\mathrm{I}_{\mathrm{OUT}}$ | - | 20 | mA |

NOTE: Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Figure B: 5.0V Output load

## Notes

During $\mathrm{V}_{\mathrm{CC}}$ power-up, a pull-up resistor to $\mathrm{V}_{\mathrm{CC}}$ on $\overline{\mathrm{CE}}$ is required to meet $\mathrm{I}_{\mathrm{SB}}$ specification.
This parameter is sampled, but not $100 \%$ tested.
For test conditions, see AC Test Conditions, Figures A and B.
These parameters are specified with $C_{L}=5 \mathrm{pF}$, as in Figure B. Transition is measured $\pm 500 \mathrm{mV}$ from steady-state voltage.
This parameter is guaranteed, but not $100 \%$ tested.
$\overline{\mathrm{WE}}$ is High for read cycle.
$\overline{\mathrm{CE}}$ and $\overline{\mathrm{OE}}$ are Low for read cycle.
Address valid prior to or coincident with $\overline{\mathrm{CE}}$ transition Low.
All read cycle timings are referenced from the last valid address to the first transitioning address.
Not applicable.
All write cycle timings are referenced from the last valid address to the first transitioning address.
Not applicable.
$\mathrm{C}=30 \mathrm{pF}$, except on High Z and Low Z parameters, where $\mathrm{C}=5 \mathrm{pF}$.
