## AS1119

## 144-LED Cross-Plexing Driver with 320mA Charge-Pump

## General Description

The AS1119 is a compact LED driver for 144 (90) single LEDs. The devices can be programmed via an $1^{2} \mathrm{C}$ compatible interface.
The AS1119 offers two blocks driving each 72 LEDs (3 blocks each 30LEDs) with $1 / 9(1 / 6)$ cycle rate. The required lines to drive all 144 (90) LEDs are reduced to 18 by using the cross-plexing feature optimizing space on the PCB. Every block driving $72(30)$ LEDs can be analog dimmed from 1 to 30 mA in 256 steps (8 bit).

Additionally each of the 144 (90) LEDs can be dimmed individually with 8 -bit allowing 256 steps of linear dimming. To reduce CPU usage up to 6 frames can be stored with individual time delays between frames to play small animations automatically.
The AS1119 operates from 2.7 V to 5.5 V and includes a 320 mA charge-pump to drive also white LEDs. The charge-pump operates in 2:3 and 1:2 mode.

The AS1119 features very low shutdown and operational current. The device is available in a ultrasmall 36-pin WL-CSP.
Ordering Information and Content Guide appear at end of datasheet.

## Key Benefits \& Features

The benefits and features of the AS1119, 144-LED Cross-Plexing Driver with 320 mA Charge-Pump are listed below:

Figure 1:
Added Value of Using AS1119

| Benefits | Features |
| :--- | :--- |
| - Excellent PCB real estate vs LED count | - Up to 144 LEDs as $2 \times 8 \times 9$ or $3 \times 5 \times 6$ |
| - 16.7 M full color matrix with white balance | - 8 bit PWM per LED and current control per matrix |
| - Reduces MCU load and increases battery <br> lifetime | - 6 frames of memory |
| - Extends battery lifetime while reducing BOM <br> and increasing ease of use | - Internal automatic charge pump |

- $1 \mathrm{MHz} \mathrm{I}^{2} \mathrm{C}$-compatible interface
- Open and shorted LED error detection
- 144 LEDs in dot matrix
- Low-power shutdown current
- Individual 8-bit LED PWM control
-8-bit analog brightness control
- (1:1), 2:3, 1:2 320mA charge pump
- 6 frames memory for animations
- System-clk synchronisation for multiple devices
- Supply voltage range: 2.7 V to 5.5 V
- Minimum PCB space required
- 36-pin WL-CSP package

## Applications

The AS1119 is ideal for dot matrix displays in mobile phones, personal electronics and toys.

| CS12-CS17 | E4-E2, F4-F2 |  |  |

## Absolute Maximum Ratings

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under Electrical Characteristics is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Figure 6:
Absolute Maximum Ratings

| Parameter | Min | Max | Unit | Comments |
| :---: | :---: | :---: | :---: | :---: |
| Electrical Parameters |  |  |  |  |
| $\mathrm{V}_{\mathrm{DD}}$ to GND | -0.3 | 7 | v |  |

## Detailed Description

## $I^{2}$ C Interface

The AS1119 supports the $I^{2} C$ serial bus and data transmission protocol in fast mode at 1 MHz . The AS1119 operates as a slave on the $I^{2} \mathrm{C}$ bus. The bus must be controlled by a master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions. Connections to the bus are made via the open-drain I/O pins SCL and SDA.

Figure 20:
$I^{2}$ C Interface Initialization

Figure 21:
Bus Protocol

The bus protocol (as shown in Figure 21) is defined as:

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is HIGH. Changes in the data line while the clock line is HIGH will be interpreted as control signals.

The bus conditions are defined as:

- Bus Not Busy. Data and clock lines remain HIGH.
- Start Data Transfer. A change in the state of the data line, from HIGH to LOW, while the clock is HIGH, defines a START condition.
- Stop Data Transfer. A change in the state of the data line, from LOW to HIGH, while the clock line is HIGH, defines the STOP condition.
- Data Valid. The state of the data line represents valid data, when, after a START condition, the data line is stable for the duration of the HIGH period of the clock signal. There is one clock pulse per bit of data. Each data transfer is initiated with a START condition and terminated with a STOP condition. The number of data bytes transferred between START and STOP conditions is not limited and is determined by the master device. The information is transferred byte-wise and each receiver acknowledges with a ninth-bit. Within the $I^{2} C$ bus specifications a high-speed mode ( 3.4 MHz clock rate) is defined.
- Acknowledge. Each receiving device, when addressed, is obliged to generate an acknowledge after the reception of each byte. The master device must generate an extra clock pulse that is associated with this acknowledge bit. A device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Ofcourse, setup and hold times must be taken into account. A master must signal an end of data to the slave by not generating an acknowledge bit on the last byte that has been clocked out of the slave. In this case, the slave must leave the data line HIGH to enable the master to generate the STOP condition.
- Figure 21 details how data transfer is accomplished on the $I^{2} \mathrm{C}$ bus. Depending upon the state of the R/ $\overline{\mathrm{W}}$ bit, two types of data transfer are possible:
- Master Transmitter to Slave Receiver. The first byte transmitted by the master is the slave address, followed by a number of data bytes. The slave returns an acknowledge bit after the slave address and each received byte.
- Slave Transmitter to Master Receiver. The first byte, the slave address, is transmitted by the master. The slave then returns an acknowledge bit. Next, a number of data bytes are transmitted by the slave to the master. The master returns an acknowledge bit after all received bytes other than the last byte. At the end of the last received byte, a not-acknowledge is returned. The master device generates all of the serial clock pulses and the START and STOP conditions. A transfer is ended with a STOP condition or a repeated START condition. Since a repeated START condition is also the beginning of the next serial transfer, the bus will not be released.

The AS1119 can operate in the following slave modes:

- Slave Receiver Mode. Serial data and clock are received through SDA and SCL. After each byte is received, an acknowledge bit is transmitted. START and STOP conditions are recognized as the beginning and end of a serial transfer. Address recognition is performed by hardware after reception of the slave address and direction bit.
- Slave Transmitter Mode. The first byte (the slave address) is received and handled as in the slave receiver mode. However, in this mode the direction bit will indicate that the transfer direction is reversed. Serial data is transmitted on SDA by the AS1119 while the serial clock is input on SCL. START and STOP conditions are recognized as the beginning and end of a serial transfer.

## $I^{2}$ C Device Address Byte

The address byte (see Figure 22) is the first byte received following the START condition from the master device.

Figure 22:
$I^{2}$ C Device Address Byte
address

- The bit 1 and bit 2 of the address byte are the device select pins AD0 and AD1, which must be set to $\mathrm{V}_{\text {DD }}$ or to GND. A maximum of four devices with the same pre-set code can therefore be connected on the same bus at one time.
- The last bit of the address byte $(R / \bar{W})$ define the operation to be performed. When set to a 1 a read operation is selected; when set to a 0 a write operation is selected.

Following the START condition, the AS1119 monitors the $I^{2} C$ bus, checking the device type identifier being transmitted. Upon receiving the address code, and the R/ $\bar{W}$ bit, the slave device outputs an acknowledge signal on the SDA line.

## Command Byte

The AS1119 operation, (see Figure 21) is determined by a command byte (see Figure 23).

Figure 23:
Command Byte

| MSB | 6 | 5 | 4 | 3 | 2 | 1 | LSB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Figure 24:
Command and Single Data Byte Received by AS1119

Figure 25:
Setting the Pointer to a Address Register to Select a Data Register for a Read Operation

Figure 26:
Reading n Bytes from AS1119

## Initial Power-Up

On initial power-up, the AS1119 registers are reset to their default values, the display is blanked, and the device goes into shutdown mode. At this time, all registers should be programmed for normal operation.
Note(s):The default settings enable only scanning of one digit; the internal decoder is disabled and the Intensity Control Register (see Figure 32) and (see Figure 37) is set to the minimum values.

## Shutdown Mode

The AS1119 device features two different shutdown modes. A software shutdown via shutdown register (see Shutdown Register ( $0 \times 0 \mathrm{~A}$ )) and a hardware shutdown via the RSTN pin.

The software shutdown disables all LEDs and stops the internal operation of the logic. A shutdown mode via the RSTN pin additionally powers down the power-on-reset (PO) of the device. In this shutdown mode the AS1119 consumes only 100nA (typ.).

## amil

## Register Description

## Register Selection

Within this register the access to one of the RAM sections or to the Control selected this section is valid as long as an other section is selected.

## Data Definition of Single Frames

One frame consists of 2 blocks (a $8 \times 9$ LED-matrix) or 3 blocks (a $5 \times 6$ LED-matrix). This configuration is set in the AS1119 config register (see Figure 43).

In the internal DPRAM of the device 6 frames can be stored. For each frame the following parameters have to be stored.

- LED is ON or OFF.
- LED is steady ON or blinking.
- The intensity of every single LED can be set via a 8 bits PWM.

Note(s): After power-up the data in the DPRAM is undefined (either ' 0 ' or ' 1 ').

## 2 Blocks with 8x9 LED Matrix

The AS1119 can be configured to control two separated blocks of LEDs matrixes. This must be set via the bit D0 in the AS1119 config register (see Figure 43).

Figure 28:
8x9 LED Matrix with Two Blocks

The address structure (as shown in Figure 29) within on frame is always the same independent which frame was selected via the register selection (Register Selection Address Map).

Figure 29:
Dataframe Address Structure for 2 Matrixes

|  |  | Addresses Within Frame (HEX code) |  |  |  |  |  |

## ams Datasheet

[v2-00] 2016-Sep-21

## 3 Blocks with 5×6 LED Matrix

The AS1119 can be configured to control three separated blocks of LEDs matrixes. This must be set via the bit D0 in the AS1119 config register (see AS1119 Config Register (0x04)).

Figure 33:
5x6 LED Matrix with 3 Matrixes

In Figure 35 it's described which databit represents which LED in the matrix. Per default all databits are ' 0 ', meaning no LED is on. A ' 1 ' puts the LED On.

Note(s): LED A01 is the first LED of the Current Source 0 in the Matrix A. LED B01 is the first LED of the Current Source 6 in the Matrix B. and so on.

## Control-Registers

The AS1119 devices contain 13 control-registers which are listed in Figure 38. All registers are selected using a 8-bit address word, and communication is done via the serial interface. Select the Control Register via the Register Selection (see Figure 27).

Figure 38:
Control Register Address Map

| Register Name | HEX | Address |  |  |  |  |  |  |  | Register Data |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $I^{2}$ C Interface monitoring | 0x0B | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | (see Figure 48) |
| Open/Short status | 0x0C | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | (see Figure 49) |
| AS1119 status | 0x0D | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | (see Figure 50) |

## Frame Address Register (0x00)

In this register it must be set if a picture or a movie is to display on the LED matrix. Also the start address of the movie or the picture which should be displayed must be set within this register. The default setting of this register is $0 \times 00$.

Figure 39:
Frame Address Register Format

| 0x00 Frame Address Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |
| 7 | Play Movie | 0 | R/W | 0: No movie <br> 1: Play movie |
| 6 | Display Picture | 0 | R/W | 0: No picture <br> 1: Display picture |
| 5:3 | Start Address for movie | 000 | R/W | 000: Frame 0 <br> 001: Frame 1 <br> 010: Frame 2 <br> 011: Frame 3 <br> 100: Frame 4 <br> 101: Frame 5 |
| 2:0 | Address of Picture | 000 | R/W | 000: Frame 0 001: Frame 1 010: Frame 2 011: Frame 3 100: Frame 4 101: Frame 5 |

## Note(s):

1. If bit 6 and 7 are set to ' 1 ' the AS1119 will play the movie first and than the picture will be displayed.

## Frame Play Register (0x01)

Within this register two movie play options can be set. Per default this register is set to $0 \times 00$.

- The number of frames which are displayed in one movie.
- The number of loops to play in a movie.

Figure 40:
Frame Play Register Format

| 0x01 Frame Play Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |
| 7:6 | - | 00 | $\mathrm{n} / \mathrm{a}$ |  |
| 5:3 | Number of loops played in one movie | 000 | R/W | 000: No loop <br> 001: 1 loop <br> 010: 2 loops <br> 011: 3 loops <br> 100: 4 loops <br> 101: 5 loops <br> 110: 6 loops <br> 111: Play endless |
| 2:0 | Number of frames to played in a movie | 000 | R/W | 000: 1 frame 001: 2 frames 010: 3 frames 011: 4 frames 100: 5 frames 101: 6 frames |

## Note(s):

1. To stop a movie in play endless mode, bits D5:D3 have to be set to a value between 000 to 110 .

## Frame Time Register (0x02)

Every single frame in a movie is displayed for a certain time before the next frame is displayed. This time can be set within this register with 4 bits. The stated values in Figure 41are typical values. Per default this register is set to $0 \times 00$.

Figure 41:
Frame Time Register Format

| 0x02 Frame Time Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |
| 7:4 | - | 00 | n/a |  |
| 3:0 | Delay between frame change in a movie | 000 | R/W | 0000: Play frame only one time 0001: 32.5ms 0010: 65ms 0011: 97.5ms 0100: 130ms 0101: 162.5 ms 0110: 195ms 0111: 227.5 ms 1000: 260ms 1001: 292.5 ms 1010: 325 ms 1011:357.5ms 1100: 390ms 1101: 422.5 ms 1110: 455ms 1111:487.5ms |

## Display Option Register (0x03)

With the scan-limit it can be controlled how many digits are displayed in each matrix. When all 18 digits in the 2 matrix configuration are displayed, the display scan rate is 430 Hz (typ.). If the number of digits to display is reduced, the update frequency is increased. Per default this register is set to $0 \times 07$.

Figure 42:
Display Option Register Format

| 0x03 Display Option Register |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## AS1119 Config Register (0x04)

In this register the configuration of the charge pumps is set to 2 or 3 blocks. The direction of the SYNC_IN/SYNC_OUT pin (input or output) is also set. Per default this register is set to $0 \times 00$.

Figure 43:
AS1119 Config Register Format

| 0x04 AS1119 Config Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :--- |

Pin B6 is <br> used as clk input for system-clk. <br> $11:$ Do not use |
| 0 | Matrix configuration | 0 | R/W | $0: 3$ matrixes (a 5x6 LED-Matrix) <br> $1: 2$ matrixes (a 8x9 LED-Matrix) |

## Current Source Block A, B, C Registers (0x05, 0x06, 0x07)

Within this registers the current for every single LED in one block can be set from 0 mA to 31 mA in 255 steps ( 8 bits). Per default this register is set to $0 \times 00$.

Figure 44:
Current Source Register Format

| Current Source Registers |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |

| Address 0x07 |  |  |  |  |
| 7:0 | Analog Current Matrix C | 0000000 | R/W | 00000000: 0mA ............. <br> 11111111:31mA |

## Charge Pump Config Register (0x08)

In this register the characteristics of the Charge Pump can be set. By the use of the charge pump (bit 0 ) the supply voltage for the LEDs can be boosted to 1.5 - or 2-times of the device supply (VDD), if required. Additionally bit1 offers the option to check periodically if the LED supply can be reduced again during operation. This period is defined by bit 4:2.

Alternatively, the LED supply can be (re)set to $\mathrm{V}_{\mathrm{DD}}$ by disabling the charge pump for a short time. In this case the period can be defined by user (application). Per default this register is set to $0 x 1 \mathrm{E}$.

Figure 45:
AS1119 Charge Pump Config Register Format

| Ox08 Charge Pump Config Register |  |  |  |  |
| :---: | :--- | :---: | :---: | :--- |
| Bit | Bit Name | Default | Access | Bit Description |
| $7: 5$ | - | 000 | $\mathrm{n} / \mathrm{a}$ |  |

| :--- |
| 1 |

## Open/Short Test Register (0x09)

The AS1119 can detect open and shorted LEDs. To start this test the according bits have to be set. The result of the open/short test is written in the Open/Short startup register (see Figure 46). The default setting of this register is $0 \times 00$.

Figure 46:
Open/Short Test Register Format

| 0x09 Open/Short Test Register |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :--- | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |  |  |  |
| $7: 2$ | - | 000000 | $\mathrm{n} / \mathrm{a}$ |  |  |  |  |
| 1 | Full Matrix | 0 | R/W | 0: All LED's are available in the matrixes <br> $1:$ Not all LED's are available in the matrixes |  |  |  |
| 0 | Error detection | 0 | R/W | 0: Start test <br> $1:$ No test |  |  |  |

The Open/Short test is only checking LEDs which are defined as ON in the Data Frame Registers Figure 30 or Figure 35. With the bit1 (Full Matrix) all LEDs of the matrixes will be defined as ON and will be tested independently from the content of the Data Frame Register. The function of bit 1 is only available during the open/short test and not during normal operation.

## Shutdown Register (0x0A)

The default setting of this register is $0 \times 00$. To get the AS1119 operational the bit D0 has to be set to ' 1 '.

Figure 47:
Shutdown Register Format

| 0x0A Shutdown Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |
| $7: 1$ | - | 0000000 | $n / a$ |  |
| 0 | shutdown | 0 | R/W | 0: Shutdown <br> $1:$ Normal operation |

## $I^{2}$ C Interface Monitoring Register (0x0B)

This register is used to monitor the activity on the $I^{2} C$ bus. If a deadlock situation occurs (e.g. the bus SDA pin is pulled to low and no communication is possible) the chip will reset the $I^{2} C$ interface and the master is able to start the communication again. The time window for the reset of the interface of the AS1119 can bes set via 7 bits from $256 \mu$ s to 33 ms . The default setting of this register is $0 x F F$.

Figure 48:
$I^{2}$ C Interface Monitoring Register Format

| OxOB I $^{2} \mathrm{C}$ Interface Monitoring Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :--- |
| Bit | Bit Name | Default | Access | Bit Description |
| $7: 2$ | Time out window | 1111111 | R/W | 0 to $127=>1$ to $128 \times 256 \mu \mathrm{~s}$ <br> $0000000: 256 \mu \mathrm{~s}$ <br> $\ldots . . . . . . ~$ <br> $1111111: 32.7 \mathrm{~ms}$ |
| 0 | $I^{2} C$ Monitor | 1 | R/W | $0: 1^{2} C$ monitoring Off <br> $1: I^{2} C$ monitoring On |

## Open/Short Status Register (0x0C)

This is a read only register. Within this register the result of the open/short test can be read out. It's also stated if the test is completed or still running. The default setting of this register is $0 \times 00$.

Figure 49:
Open/Short Status Register Format

| OxOC Open/Short Status Register |  |  |  |  |
| :---: | :--- | :---: | :---: | :--- |
| Bit | Bit Name | Default | Access | Bit Description |
| 7 | - | 0 | $\mathrm{n} / \mathrm{a}$ |  |
| 6 | status | 0 | R | $0:$ No test <br> $1:$ Test ongoing |
| 5 | short test result <br> Matrix C | 0 | R | $0:$ No error detected <br> $1:$ Short in Matrix C |
| 4 | short test result <br> Matrix B | 0 | R | $0:$ No error detected <br> $1:$ Short in Matrix B |
| 3 | short test result <br> Matrix A | 0 | R | $0:$ No error detected <br> $1:$ Short in Matrix A |
| 2 | open test result <br> Matrix C | 0 | R | $0:$ No error detected <br> $1:$ Open in Matrix C |

| Ox0C Open/Short Status Register |  |  |  |  |
| :---: | :--- | :---: | :---: | :--- |
| Bit | Bit Name | Default | Access | Bit Description |
| 1 | open test result <br> Matrix B | 0 | $R$ | 0: No error detected <br> $1:$ Open in Matrix B |
| 0 | open test result <br> Matrix A | 0 | $R$ | 0: No error detected <br> $1:$ Open in Matrix A |

## AS1119 Status Register (0x0D)

This is a read only register. From this register the actual status of the AS1119 can be read out. The default setting of this register is $0 \times 00$. After a read command the bits $5: 4$ are set to ' 0 ' again automatically.

Figure 50:
AS1119 Status Register Format

| 0x0D AS1119 Status Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |
| 7 | - | 0 | n/a |  |
| 6 | Movie status |  | R | 0 : No movie is playing <br> 1: One movie is playing |
| 5:4 | Interrupt | 00 | R | 00: No Interrupt triggered <br> 01: POR triggered an interrupt ${ }^{(1)}$ <br> 10: $I^{2} \mathrm{C}$ monitor triggered an interrupt <br> 11: Both ( $I^{2} \mathrm{C}$ and POR) triggered an interrupt |
| 3:0 | actual displayed frame | 000 | R | 000: Frame 0 001: Frame 1 010: Frame 2 011: Frame 3 100: Frame 4 101: Frame 5 |

## Note(s):

1. The power-on reset is part of the start sequence, hence after start-up this bit is also set.

## RoHS Compliant \& ams Green Statement

RoHS: The term RoHS compliant means that ams AG products fully comply with current RoHS directives. Our semiconductor products do not contain any chemicals for all 6 substance categories, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, RoHS compliant products are suitable for use in specified lead-free processes.
ams Green (RoHS compliant and no Sb/Br): ams Green defines that in addition to RoHS compliance, our products are free of Bromine ( Br ) and Antimony (Sb) based flame retardants ( Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material).

Important Information: The information provided in this statement represents ams AG knowledge and belief as of the date that it is provided. ams AG bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. ams AG has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ams AG and ams AG suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

## Copyrights \& Disclaimer
