13 Gbps, Fast Rise Time XOR/XNOR Gate with Programmable Output Voltage and Positive Supply

Data Sheet

HMC745

FEATURES

Inputs terminated internally at 50 Ω
Differential and single-ended operation
Fast rise and fall times: 21 ps and 19 ps
Low power consumption: 240 mW (typical)
Programmable differential
Output voltage swing: 600 mV to 1200 mV
Propagation delay: 95 ps
Single supply: 3.3 V
16-terminal, ceramic 3 mm × 3 mm LCC package

APPLICATIONS

RF automatic test equipment (ATE) applications
Broadband test and measurement
Serial data transmission up to 13 Gbps
Digital logic systems up to 13 GHz

GENERAL DESCRIPTION

The HMC745 is a XOR/XNOR gate function designed to support data transmission rates of up to 13 Gbps, and clock frequencies as high as 13 GHz. The HMC745 also features an output level control pin, VR, which permits loss compensation or signal level optimization.

All input and output signals to the HMC745 are terminated with 50 Ω to V_{CC} on-chip, and can be either ac-coupled or dc-coupled.
FUNCTIONAL BLOCK DIAGRAM

Figure 1.

Inputs or outputs can be connected directly to a 50 Ω V_{CC} terminated system, while dc blocking capacitors may be used if the terminating system is 50 Ω to ground. The HMC745 operates from a single 3.3 V dc supply, and is available in a ceramic, RoHS compliant, 3 mm × 3 mm LCC package.

Human Body Model (HBM)	Class 1C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

The HMC745 consists of an XOR/XNOR stage followed by an output driver stage. The XOR/XNOR stage accepts two differential input pairs; AN/AP and BN/BP, and gives one differential output. The following output driving stage drives the line with a 50 Ω single-ended or 100 Ω differential. The output stage has a tunable voltage swing feature that allows the tune to swing between 600 mV p-p to 1200 mV p–p. All input and output interfaces are referenced to 3.3 V with a 50 Ω resistor.

APPLICATIONS INFORMATION

EVALUATION PRINTED CIRCUIT BOARD (PCB)

The circuit board used in the application must use RF circuit design techniques. Signal lines must have 50 Ω impedance while the package ground leads must be connected directly to the ground plane. The exposed package base must be connected to GND. A sufficient number of via holes must be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Analog Devices, Inc., upon request.
