

# Multiple Range, 16-Bit, Bipolar/Unipolar Voltage Output DAC with 7 ppm/°C Reference

Enhanced Product

## AD5761R-EP

### FEATURES

- 8 software-programmable output ranges: 0 V to 5 V, 0 V to 10 V, 0 V to 16 V, 0 V to 20 V, -2.5 V to +7.5 V, ±3 V, ±5 V, and ±10 V; 5% overrange
- Low drift 2.5 V reference: ±7 ppm/°C typical
- TUE: ±0.1% FSR maximum
- 16-bit relative accuracy (INL): ±8 LSB maximum
- Guaranteed monotonicity (DNL): ±1 LSB maximum
- Single channel, 16-bit DAC
- Output voltage settling time
  - 7.5 μs typical, 10 V step to 1 LSB at 16-bit resolution
- Integrated reference buffers
- Low noise: 35 nV/√Hz (±3 V range)
- Low glitch: 1 nV-sec (0 V to 5 V range)
- 1.7 V to 5.5 V digital supply range (DV<sub>CC</sub>)
- Asynchronous updating via  $\overline{\text{LDAC}}$
- Asynchronous  $\overline{\text{RESET}}$  to zero scale/midscale
- DSP-/microcontroller-compatible serial interface
- Robust 4 kV HBM ESD rating
- 16-lead TSSOP package
- Operating temperature range: -55°C to +125°C

### ENHANCED PRODUCT FEATURES

- Supports defense and aerospace applications (AQEC standard)
- Military temperature range: -55°C to +125°C
- Controlled manufacturing baseline
- 1 assembly/test site
- 1 fabrication site
- Enhanced product change notification
- Qualification data available on request

### APPLICATIONS

- Industrial automation
- Instrumentation, data acquisition
- Open-/closed-loop servo control, process control
- Programmable logic controllers

### GENERAL DESCRIPTION

The AD5761R-EP is a single-channel, 16-bit serial input, voltage output, digital-to-analog converter (DAC). It operates from single-supply voltages from 4.75 V to 30 V V<sub>DD</sub> or dual supply voltages from -16.5 V to 0 V V<sub>SS</sub> and 4.75 V to 16.5 V V<sub>DD</sub>. The integrated output amplifier, reference buffer, and reference provide an easy to use, universal solution.

The device offers guaranteed monotonicity, integral nonlinearity (INL) of ±8 LSB maximum, 35 nV/√Hz noise, and a 7.5 μs settling time on selected ranges.

The AD5761R-EP uses a serial interface that operates at clock rates of up to 50 MHz and is compatible with digital signal processor (DSP) and microcontroller interface standards. Double buffering allows the asynchronous updating of the DAC output. The input coding is user selectable, twos complement or straight binary. The asynchronous reset function resets all registers to their default state. The output range is user selectable via the RA[2:0] bits in the control register.

The device is available in a 16-lead TSSOP package, and it offers guaranteed specifications over the -55°C to +125°C military temperature range.

Additional application and technical information can be found in the AD5761R data sheet.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

### ESD CAUTION

#### ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

## NOTES

1. DNC = DO NOT CONNECT. DO NOT CONNECT TO THIS PIN.

122855-003

Figure 3. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	<u>ALERT</u>	Active Low Alert. This pin is asserted low when the die temperature exceeds approximately 150°C, or when an output short circuit or a brownout occurs. This pin is also asserted low during power-up, a full software reset, or a hardware reset for which a write to the control register asserts the pin high.
2	<u>CLEAR</u>	Falling Edge Clear Input. Asserting this pin sets the DAC register to zero-scale, midscale, or full-scale code (user selectable) and updates the DAC output. This pin can be left floating because there is an internal pull-up resistor.
3	<u>RESET</u>	Active Low Reset Input. Asserting this pin returns the AD5761R-EP to its default power-on status where the output is clamped to ground, and the output buffer is powered down. This pin can be left floating because there is an internal pull-up resistor.
4	$V_{REFIN}/V_{REFOUT}$	Internal Reference Voltage Output and External Reference Voltage Input. For specified performance, $V_{REFIN}/V_{REFOUT} = 2.5$ V. Connect a 10 nF capacitor with the internal reference to minimize the noise.
5	AGND	Ground Reference Pin for Analog Circuitry.
6	$V_{SS}$	Negative Analog Supply Connection. A voltage in the range of $-16.5$ V to 0 V can be connected to this pin. For unipolar output ranges, connect this pin to 0 V. $V_{SS}$ must be decoupled to AGND.
7	$V_{OUT}$	Analog Output Voltage of the DAC. The output amplifier is capable of directly driving a 2 k $\Omega$ , 1 nF load.
8	$V_{DD}$	Positive Analog Supply Connection. A voltage in the range of 4.75 V to 30 V can be connected to this pin for unipolar output ranges. Bipolar output ranges accept a voltage in the range of 4.75 V to 16.5 V. $V_{DD}$ must be decoupled to AGND.
9	DNC	Do Not Connect. Do not connect to this pin.
10	SDO	Serial Data Output. This pin clocks data from the serial register in daisy-chain or readback mode. Data is clocked out on the rising edge of SCLK and is valid on the falling edge of SCLK.
11	<u>LDAC</u>	Load DAC. This logic input updates the DAC register and, consequently, the analog output. When tied permanently low, the DAC register is updated when the input register is updated. If <u>LDAC</u> is held high during the write to the input register, the DAC output register is not updated, and the DAC output update is held off until the falling edge of <u>LDAC</u> . This pin can be left floating because there is an internal pull-up resistor.
12	SDI	Serial Data Input. Data must be valid on the falling edge of SCLK.
13	<u>SYNC</u>	Active Low Synchronization Input. This pin is the frame synchronization signal for the serial interface. While <u>SYNC</u> is low, data is transferred in on the falling edge of SCLK. Data is latched on the rising edge of <u>SYNC</u> .
14	SCLK	Serial Clock Input. Data is clocked into the input shift register on the falling edge of SCLK. This pin operates at clock speeds of up to 50 MHz.
15	DV <sub>CC</sub>	Digital Supply. The voltage range is from 1.7 V to 5.5 V. The applied voltage sets the voltage at which the digital interface operates.
16	DGND	Digital Ground.
