## Data Sheet

## FEATURES

Fixed gain of $\mathbf{2 0 ~ d B}$<br>Operational frequency of 1 MHz to 2.7 GHz<br>Linear output power up to 9 dBm<br>Input/output internally matched to $50 \Omega$<br>Temperature and power supply stable<br>Noise figure: 5.3 dB<br>Power supply: 3 V or 5 V

## APPLICATIONS

## VCO buffers

General Tx/Rx amplification
Power amplifier predrivers
Low power antenna drivers

## GENERAL DESCRIPTION

The AD8353 is a broadband, fixed-gain, linear amplifier that operates at frequencies from 1 MHz up to 2.7 GHz . It is intended for use in a wide variety of wireless devices, including cellular, broadband, CATV, and LMDS/MMDS applications.

By taking advantage of Analog Devices, Inc., high performance, complementary Si bipolar process, these gain blocks provide excellent stability over process, temperature, and power supply. This amplifier is single-ended and internally matched to $50 \Omega$ with a return loss of greater than 10 dB over the full operating frequency range.

The AD8353 provides linear output power of 9 dBm with 20 dB of gain at 900 MHz when biased at 3 V and an external RF choke is connected between the power supply and the output pin. The dc supply current is 42 mA . At 900 MHz , the output third-order intercept (OIP3) is greater than 23 dBm and is 19 dBm at 2.7 GHz .

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

The noise figure is 5.3 dB at 900 MHz . The reverse isolation $\left(\mathrm{S}_{12}\right)$ is -36 dB at 900 MHz and -30 dB at 2.7 GHz .

The AD8353 can also operate with a 5 V power supply; in which case, no external inductor is required. Under these conditions, the AD8353 delivers 8 dBm with 20 dB of gain at 900 MHz . The dc supply current is 42 mA . At 900 MHz , the OIP3 is greater than 22 dBm and is 19 dBm at 2.7 GHz . The noise figure is 5.6 dB at 900 MHz . The reverse isolation $\left(\mathrm{S}_{12}\right)$ is -35 dB .

The AD8353 is fabricated on Analog Devices proprietary, high performance, 25 GHz , Si complementary, bipolar IC process. The AD8353 is available in a chip scale package that uses an exposed paddle for excellent thermal impedance and low impedance electrical connection to ground. It operates over a $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range, and an evaluation board is also available.

ABSOLUTE MAXIMUM RATINGS

Table 3.

| Parameter | Rating |
| :--- | :--- |
| Supply Voltage, VPOS | 5.5 V |
| Input Power (re: $50 \Omega$ ) | 10 dBm |
| $\quad$ Equivalent Voltage | 700 mV rms |
| Internal Power Dissipation |  |
| $\quad$ Paddle Not Soldered | 325 mW |
| $\quad$ Paddle Soldered | 812 mW |
| $\theta_{\mathrm{JA}}$ (Paddle Soldered) | $80^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\theta_{\mathrm{JA}}$ (Paddle Not Soldered) | $200^{\circ} \mathrm{C} / \mathrm{W}$ |
| Maximum Junction Temperature | $150^{\circ} \mathrm{C}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Lead Temperature (Soldering, 60 sec ) | $260^{\circ} \mathrm{C}$ |

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## ESD CAUTION

|  | ESD (electrostatic discharge) sensitive device. <br> Charged devices and circuit boards can discharge <br> without detection. Although this product features <br> patented or proprietary protection circuitry, damage <br> may occur on devices subjected to high energy ESD. <br> Therefore, proper ESD precautions should be taken to <br> avoid performance degradation or loss of functionality. |

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Table 4. Pin Function Descriptions

| Pin No. | Mnemonic | Description |
| :--- | :--- | :--- |
| 1,8 | COM1 | Device Common. Connect to low impedance ground. |
| 2 | NC | No Connection. |
| 3 | RFIN | RF Input Connection. Must be ac-coupled. |
| 4,5 | COM2 | Device Common. Connect to low impedance ground. |
| 6 | VPOS | Positive Supply Voltage. |
| 7 | RFOUT | RF Output Connection. Must be ac-coupled. |
|  | EPAD | Exposed Pad. The exposed pad must be connected to a low impedance ground pad. |

## THEORY OF OPERATION

The AD8353 is a 2-stage, feedback amplifier employing both shunt-series and shunt-shunt feedback. The first stage is degenerated and resistively loaded and provides approximately 10 dB of gain. The second stage is a PNP-NPN Darlington output stage, which provides another 10 dB of gain. Seriesshunt feedback from the emitter of the output transistor sets the input impedance to $50 \Omega$ over a broad frequency range. Shuntshunt feedback from the amplifier output to the input of the Darlington stage helps to set the output impedance to $50 \Omega$. The amplifier can be operated from a 3 V supply by adding a choke inductor from the amplifier output to VPOS. Without this choke inductor, operation from a 5 V supply is also possible.

## BASIC CONNECTIONS

The AD8353 RF gain block is a fixed gain amplifier with single-ended input and output ports whose impedances are nominally equal to $50 \Omega$ over the frequency range 1 MHz to 2.7 GHz . Consequently, it can be directly inserted into a $50 \Omega$ system with no impedance matching circuitry required. The input and output impedances are sufficiently stable vs. variations in temperature and supply voltage that no impedance matching compensation is required. A complete set of scattering parameters is available at http://www.analog.com.

The input pin (RFIN) is connected directly to the base of the first amplifier stage, which is internally biased to approximately 1 V ; therefore, a dc blocking capacitor should be connected between the source that drives the AD8353 and the input pin, RFIN.

It is critical to supply very low inductance ground connections to the ground pins (Pin 1, Pin 4, Pin 5, and Pin 8) as well as to the backside exposed paddle. This ensures stable operation.

The AD8353 is designed to operate over a wide supply voltage range, from 2.7 V to 5.5 V . The output of the part, RFOUT, is taken directly from the collector of the output amplifier stage. This node is internally biased to approximately 2.2 V when the supply voltage is 5 V . Consequently, a dc blocking capacitor should be connected between the output pin, RFOUT, and the load that it drives. The value of this capacitor is not critical, but it should be 100 pF or larger.

When the supply voltage is 3 V , it is recommended that an external RF choke be connected between the supply voltage and the output pin, RFOUT. This increases the dc voltage applied to the collector of the output amplifier stage, which improves performance of the AD8353 to be very similar to the performance produced when 5 V is used for the supply voltage. The inductance of the RF choke should be approximately 100 nH , and care should be taken to ensure that the lowest series self-resonant frequency of this choke is well above the maximum frequency of operation for the AD8353. For lower frequency operation, use a higher value inductor.

Bypass the supply voltage input, VPOS, using a large value capacitance (approximately $0.47 \mu \mathrm{~F}$ or larger) and a smaller, high frequency bypass capacitor (approximately 100 pF ) physically located close to the VPOS pin.

The recommended connections and components are shown in Figure 41.

## APPLICATIONS INFORMATION

The AD8353 RF gain block can be used as a general-purpose, fixed gain amplifier in a wide variety of applications, such as a driver for a transmitter power amplifier (see Figure 38). Its excellent reverse isolation also makes this amplifier suitable for use as a local oscillator buffer amplifier that would drive the local oscillator port of an upconverter or downconverter mixer (see Figure 39).

## LOW FREQUENCY APPLICATIONS BELOW 100 MHz

The AD8353 RF gain block can be used below 100 MHz . To accomplish this, the series dc blocking capacitors, C 1 and C 2 , need to be changed to a higher value that is appropriate for the desired frequency. C 1 and C 2 were changed to $0.1 \mu \mathrm{~F}$ to accomplish the sweep in Figure 40.

## EVALUATION BOARD

Figure 41 shows the schematic of the AD8353 evaluation board. Note that L1 is shown as an optional component that is used to obtain maximum gain only when $\mathrm{V}_{\mathrm{P}}=3 \mathrm{~V}$. The board is powered by a single supply in the 2.7 V to 5.5 V range. The power supply is decoupled by a $0.47 \mu \mathrm{~F}$ and a 100 pF capacitor.

Figure 41. Evaluation Board Schematic

Table 5. Evaluation Board Configuration Options

| Component | Function | Default <br> Value |
| :--- | :--- | :--- |
| C1, C2 | AC coupling capacitors. | 1000 pF, |
| C3 |  | 0603 |
| C4 | High frequency bypass capacitor. | 100 pF |
| L1 |  | 0603 |
|  | Low frequency bypass capacitor. | $0.47 \mu \mathrm{~F}$, |
|  | Optional RF choke, used to increase | 0603 |
|  | Current through output stage when | 0603 |
|  | $\mathrm{~V}_{\mathrm{P}}=3 \mathrm{~V}$. . Not recommended for use |  |
|  | when $\mathrm{V}_{\mathrm{P}}=5 \mathrm{~V}$. |  |
