## FEATURES

High accuracy, high-resolution voltage outputs
1 mV channel matching
12-bit input resolution
Laser-trimmed outputs
Fast settling, high voltage drive
35 ns settling time to $0.25 \%$ into $\mathbf{1 5 0}$ pF load
Slew rate $420 \mathrm{~V} / \mu \mathrm{s}$
Outputs to within 1.3 V of supply rails
High update rates
Fast, 110 MHz clock
Programmable video reference (brightness) and full-scale (contrast) output levels

## Flexible logic

INV bit reverses polarity of video signal
R/L reverses loading order of data
ISW selects frame/row or column/dot inversion
DSW selects single or dual data bus mode
Output short-circuit protection
3.3 V logic, 11 V to 18 V analog supplies

Available in $\mathbf{8 0}$-lead, $12 \mathrm{~mm} \times 12 \mathrm{~mm}$, TQFP E-pad

## APPLICATIONS

LCD microdisplay driver

## GENERAL DESCRIPTION

The AD8387 DecDriver provides dual, fast latched, 12-bit decimating input, which drives 12 high voltage outputs. Twelvebit input words are loaded into 12 separate high speed, bipolar DACs sequentially. Flexible digital input format allows more than one AD8387 to be used in parallel for higher resolution displays. The output signal can be adjusted for dc reference, signal inversion, and contrast for maximum flexibility.

The AD8387 is fabricated on ADI's fast bipolar, 26 V XFCB process, providing fast input logic, bipolar DACs with trimmed accuracy and fast settling, high voltage, precision drive amplifiers on the same chip.

The AD8387 dissipates 1.34 W nominal static power. The AD8387 is offered in an 80-lead TQFP E-pad package and operates over the commercial temperature range of $0^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

| Lead Temperature Range (Soldering 10 sec ) | $300^{\circ} \mathrm{C}$ |
| ${ }^{1}$ 80-lead TQFP E-Pad:$\begin{aligned} & \theta_{\mathrm{JA}}=28.5^{\circ} \mathrm{C} / \mathrm{W} \text { (still air) [JEDEC Standard, 4-layer PCB in still air] } \\ & \theta_{\mathrm{JC}}=12.2^{\circ} \mathrm{C} / \mathrm{W} \\ & \theta_{\mathrm{JB}}=14.6^{\circ} \mathrm{C} / \mathrm{W} \\ & \Psi_{\mathrm{JB}}=12.0^{\circ} \mathrm{C} / \mathrm{W} \\ & \Psi_{J T}=0.3^{\circ} \mathrm{C} / \mathrm{W} . \end{aligned}$ |  |
| Stresses above those listed under the Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to the absolute maximum ratings for extended periods may reduce device reliability. |  |

## EXPOSED PADDLE

To ensure optimized thermal performance, the exposed paddle must be thermally connected to an external plane, such as AVCC or GND, as described in the Applications section.

## OVERLOAD PROTECTION

The AD8387 overload protection circuit consists of an output current limiter and a thermal switch.

When TSW is LOW, the thermal switch is disabled and the output current limiter is enabled. The maximum current at any one output is internally limited to 100 mA average. In the event of a momentary short-circuit between a video output and a power supply rail (VCC or AGND), the output current limit is sufficiently low to provide temporary protection.

When TSW is HIGH, the output current limiter, as well as the thermal switch, is enabled. The thermal switch debiases the output amplifier when the junction temperature reaches the internally set trip point. In the event of an extended shortcircuit between a video output and a power supply rail, the output amplifier current continues to switch between 0 and 100 mA typical with a period determined by the thermal time constant and the hysteresis of the thermal trip point. The thermal switch, when enabled, provides long-term protection from accidental shorts during the assembly process by limiting the average junction temperature to a safe level.

## MAXIMUM POWER DISSIPATION

The maximum power that the AD8387 can safely dissipate is limited by its junction temperature. The maximum safe junction temperature for plastic encapsulated devices, as determined by the glass transition temperature of the plastic, is approximately $150^{\circ} \mathrm{C}$. Exceeding this limit temporarily can cause a shift in the parametric performance due to a change in the stresses exerted on the die by the package. Exceeding a junction temperature of $150^{\circ} \mathrm{C}$ for an extended period can result in device failure.

## OPERATING TEMPERATURE RANGE

To ensure operation within the specified operating temperature range, it is necessary to limit the maximum power dissipation as follows.

Figure 3. Maximum Power Dissipation vs. Temperature, AD8387 on a 4-Layer JEDEC PCB with Thermally Optimized Landing Pattern as Described in the Applications Section

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## AD8387

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Table 3. 80-Lead TQFP E-Pad Pin Configurations

| Pin No. | Mnemonic | Function | Description |
| :---: | :---: | :---: | :---: |
| 1 to 7 , 76 to 80; | DBA(0:11) | Data Input | 12-Bit Data Input for Even Channels. VID( $0,2,4,6,8,10$, MSB = DBA11 |
| 14 to 25 | DBB $(0: 11)$ | Data Input | 12-Bit Data Input for Odd Channels. VID (1, 3, 5, 7, 9, 11), MSB = DBB11. |
| 8 | XFR | Transfer/Start Sequence | Simultaneously initiates a new data loading sequence and transfers data loaded previously, to the outputs. |
| 9, 26, 75 | DVCCx | Digital Power Supplies | Digital Power Supplies. |
| 10, 27, 74 | DGNDx | Digital Ground | These pins are normally connected to the digital ground plane. |
| 11 | CLK | Clock | Clock Input. |
| 12 | DSW | Data Mode Switch | Selects Single Buss or Dual Buss Operating Modes. |
| 13 | R/L | Right/Left Select | Selects Left Direction or Right Direction Operating Mode. |
| 28 | ISW | Invert Mode Switch | Enables and Disables Column Inversion. |
| 29 | INV | Invert | Changes the Polarity of the Analog Output Signals. |
| 30 | GSW | Output Mode Switch | Enables and Disables Grounded Mode. |
| 31 | TSW | Thermal Switch | Enables and Disables Long-Term Output Protection. |
| $\begin{aligned} & 32,33,39,43 \\ & 47,51,55,59 \\ & 63,69,70 \end{aligned}$ | AGNDx | Analog Ground | Analog Supply Returns. |
| $\begin{aligned} & 34,35,41, \\ & 45,49,53 \\ & 57,61,67,68 \end{aligned}$ | AVCCx | Analog Power Supplies | Analog Power Supplies. |
| $36$ | BYP | Bypass | A $0.1 \mu \mathrm{~F}$ capacitor connected between BYP and AGND ensures optimum settling time. |
| 37 | TSTA | Test Pin | Connect This Pin to AGND. |
| 38,71 to 73 | NC | NC | No Connect. No internal connection. |
| $\begin{aligned} & 40,42,44,46 \\ & 48,50,52,54 \\ & 56,58,60,62 \end{aligned}$ | VID0 to VID11 | Analog Outputs | These pins are connected directly to the analog inputs of the LCD panel. |
| $64$ | VRL | Video Center Reference | This Voltage Sets the Video Center Voltage. The video outputs are above this reference while INV = HIGH and below this reference while INV = LOW. |
| 65,66 | VRH | Full-Scale Reference | Twice the voltage applied between VRH and VRL sets the full-scale video output voltage. |

## FUNCTIONAL DESCRIPTION

The AD8387 is a system building block designed to directly drive the columns of LCD microdisplays of the type popularized for use in projection systems. It has 12 channels of precision, 12-bit DACs loaded from a dual, high speed, 12 -bit wide input. Precision current feedback amplifiers, providing well damped pulse response and fast voltage settling into large capacitive loads, buffer the 12 outputs. Laser trimming at the wafer level ensures low absolute output errors and tight channel-to-channel matching. Tight part-to-part matching in high resolution systems is guaranteed by the use of external voltage references.

## REFERENCE AND CONTROL INPUT DESCRIPTION

Data Transfer/Start Sequence Control—Input Data Loading, Data Transfer
A valid XFR is initiated when it is held HIGH during a rising CLK edge.

Data is transferred to the outputs and a new loading sequence is initiated on the next rising CLK edge, immediately following a valid XFR.

During a loading sequence, 12 -bit words are loaded sequentially into 12 internal channels.

When the AD8387 is configured for single data bus (DSW = LOW), data is loaded on both the rising and falling edges of CLK. When configured for dual data bus (DSW = HIGH), data is loaded on the rising edges of CLK only.

## DSW Control—Data Mode Switch

When this input is HIGH, the AD8387 is in dual data bus mode. Data is loaded from both $\operatorname{DBA}(0: 11)$ and $\operatorname{DBB}(0: 11)$ on the rising CLK edge simultaneously. R/L does not change the active CLK edge in dual data bus mode. When LOW, the AD8387 is in single data bus mode. Data is loaded on the rising CLK edge from $\operatorname{DBA}(0: 11)$ and on the falling CLK edge from $\operatorname{DBB}(0: 11)$ when R/L is LOW. With R/L HIGH, data is loaded on the falling CLK edge from $\operatorname{DBA}(0: 11)$ and on the rising CLK edge from $\operatorname{DBB}(0: 11)$.

## Right/Left Control—Input Data Loading

To facilitate image mirroring, the direction of the loading sequence is set by the $\mathrm{R} / \mathrm{L}$ control. A new loading sequence begins at Channel 0 and proceeds to Channel 11 when the R/L control is held LOW. It begins at Channel 11 and proceeds to Channel 0 when the R/L control is held HIGH.

## TSW Control-Thermal Switch Control

When this input is HIGH, the thermal switch is enabled. When LOW or left unconnected, the thermal switch is disabled.

An internal, $10 \mathrm{k} \Omega$ pull-down resistor disables the thermal switch when this pin is left unconnected.

## GSW Control—Output Mode Switch

When this input is HIGH, the video outputs operate normally. When LOW or left open, the video outputs are forced to AGND. This function operates when AVCC power is off but requires DVCC power to be on.

## INV Control and ISW Control—Analog Output Inversion

When ISW = LOW, the analog outputs' transfer function is below VRL, while INV is held LOW, and is above VRL, while INV is held HIGH.

With ISW = HIGH, the analog outputs' transfer function is above VRL for $\operatorname{VID}(0,2,4,6,8,10)$ and is below VRL for $\operatorname{VID}(1,3,5,7,9,11)$, while INV is held HIGH. Conversely, the analog outputs' transfer function is below $\operatorname{VRL}$ for $\operatorname{VID}(0,2,4$, $6,8,10)$ and is above $\operatorname{VRL}$ for $\operatorname{VID}(1,3,5,7,9,11)$, while $\operatorname{INV}$ is held LOW.

## VRH, VRL Inputs-Full-Scale Video Reference Inputs

Two times the difference between VRH and VRL (analog input voltages) sets the full-scale output voltage.

$$
V F S=2 \times(V R H-V R L)
$$

## THEORY OF OPERATION

## TRANSFER FUNCTION AND ANALOG OUTPUT VOLTAGE

The DecDriver has two regions of operation where the video output voltages are either above or below the reference voltage VRL. The transfer function defines the video output voltage as the function of the digital input code as:

$$
\begin{aligned}
& \operatorname{VOUTN}(n)=V I D x(n)=V R L+V F S \times(1-n / 4095), \\
& \text { for } \operatorname{INV}=\operatorname{HIGH} \\
& \operatorname{VOUTP}(n)=V I D x(n)=V R L-V F S \times(1-n / 4095), \\
& \text { for } \operatorname{INV}=L O W
\end{aligned}
$$

where $n$ is the input code.

$$
V F S=2 \times(V R H-V R L)
$$

A number of internal limits define the usable range of the video output voltages, VIDx, as shown in Figure 17.

Figure 17. AD8387 Transfer Function and Usable Voltage Ranges

## ACCURACY

To best correlate transfer function errors to image artifacts, the overall accuracy of the DecDriver is defined by three parameters, VDE , VCME, and $\triangle$ VDE.
$V D E$, the differential error voltage, measures the difference between the rms value of a channel and the ideal rms value of that channel. The defining expression is

$$
\operatorname{VDE}(n)=\frac{[\operatorname{VOUTN}(n)-\operatorname{VOUTP}(n)]}{2}-\left(1-\frac{n}{4095}\right) \times \operatorname{VFS}
$$

VCME, the common-mode error voltage, measures $1 / 2$ the dc bias of a channel. The defining expression is

$$
\operatorname{VCME}(n)=\frac{1}{2}\left[\frac{\operatorname{VOUTN}(n)+\operatorname{VOUTP}(n)}{2}-\operatorname{VRL}\right]
$$

$\triangle V D E$ measures the maximum VDE mismatch between channels. The defining equation is

$$
\Delta V D E=\max \left\{V D E(n)_{(0-1)}\right\}-\min \left\{V D E(n)_{(0-1)}\right\}
$$

$\Delta \mathrm{V}$ measures the maximum mismatch between channels. The defining expression is

$$
\Delta V(n)=\max \{\Delta V N(n), \Delta V P(n)\}
$$

where:

$$
\begin{aligned}
& \Delta V N(n)=\max \left\{\operatorname{VOUTN}(n)_{(0-1))}\right\}-\min \left\{\operatorname{VOUTN}(n)_{(0-1))}\right\} \\
& \Delta V P(n)=\max \left\{\operatorname{VOUTP}(n)_{(0-1)}\right\}-\min \left\{\operatorname{VOUTP}(n)_{(0-1)}\right\}
\end{aligned}
$$

## APPLICATIONS

## OPTIMIZED RELIABILITY WITH THE THERMAL SWITCH

While internal current limiters provide short-term protection against temporary shorts at the outputs, the thermal switch provides protection against persistent shorts lasting for several seconds. To optimize reliability with the use of the thermal switch, the following sequence of operations is recommended.

## INITIAL POWER-UP AFTER ASSEMBLY OR REPAIR

Grounded output mode is disabled, and thermal switch is enabled. Ensure that the GSW pin is HIGH and that the TSW pin is HIGH upon initial power-up and that they remain unchanged throughout this procedure.

The initial power-up sequence follows:

1. Execute the initial power-up.
2. Identify any shorts at outputs. Power down, repair shorts, and repeat the initial power-up sequence until proper system functionality is verified.
3. Disable the thermal switch.

## POWER-UP DURING NORMAL OPERATION

Grounded output mode is disabled, and thermal switch is disabled.

If TSW = LOW and GSW = HIGH, all outputs go into normal operating mode with the thermal switch disabled.

## POWER SUPPLY SEQUENCING

As indicated under the Absolute Maximum Ratings, the voltage at any input pin cannot exceed its supply voltage by more than 0.5 V . Power-on and power-off sequencing can be required to comply with the absolute maximum ratings.

Failure to comply with the Absolute Maximum Ratings can result in functional failure or damage to the internal ESD diodes. Damaged ESD diodes can cause temporary parametric failures, which can result in image artifacts. Damaged ESD diodes cannot provide full ESD protection, reducing reliability.

## POWER-ON SEQUENCE

1. Turn on AVCC
2. Turn on VRH
3. Turn on VRL
4. Turn on DVCC
5. Disable thermal switch: TSW $=$ LOW
6. Turn on input signals

## POWER-OFF SEQUENCE

1. Turn off input signals
2. Turn off VRL
3. Turn off VRH
4. Turn off AVCC
5. Turn off DVCC

## GROUNDED OUTPUT MODE DURING POWER-OFF

Certain applications require that video outputs be held near AGND during power-down. The following power-off sequence ensures that the outputs are near ground during power-off and that the Absolute Maximum Ratings are not violated.

1. Enable grounded output mode: GSW $=$ LOW
2. Turn off input signals
3. Turn off VRL
4. Turn off VRH
5. Turn off AVCC
6. Turn off DVCC

## PCB DESIGN FOR OPTIMIZED THERMAL PERFORMANCE

Although the maximum safe operating junction temperature is higher, the AD8387 is $100 \%$ tested at a junction temperature of $125^{\circ} \mathrm{C}$. Consequently, the maximum guaranteed operating junction temperature is $125^{\circ} \mathrm{C}$. To limit the maximum junction temperature at or below the guaranteed maximum, the package in conjunction with the PCB must effectively conduct heat away from the junction.

The AD8387 package is designed to provide enhanced thermal characteristics through the exposed die paddle on the bottom surface of the package. To take full advantage of this feature, the exposed paddle must be in direct thermal contact with the PCB, which then serves as a heat sink.

A thermally effective PCB must incorporate two thermal pads and a thermal via structure. The thermal pad on the top surface of the PCB provides a solderable contact surface on the top surface of the PCB. The thermal pad on the bottom PCB layer provides a surface in direct contact with the ambient. The thermal via structure provides a thermal path to the inner and bottom layers of the PCB to remove heat.

## THERMAL PAD DESIGN

To minimize thermal performance degradation of production PCBs, the contact area between the thermal pad and the PCB should be maximized. Therefore, the size of the thermal pad on the top PCB layer should match the exposed paddle. The second thermal pad of the same size should be placed on the bottom side of the PCB. At least one thermal pad should be in direct thermal contact with an external plane, such as AVCC or GND.

## THERMAL VIA STRUCTURE DESIGN

Effective heat transfer from the top to the inner and bottom layers of the PCB requires thermal vias incorporated into the thermal pad design. Thermal performance increases logarithmically with the number of vias.

Near optimum thermal performance of production PCBs is attained only when tightly spaced thermal vias are placed on the full extent of the thermal pad.

## Thermal Pad and Thermal via Connections

The thermal pad on the solder side is connected to a plane. The use of thermal spokes is not recommended when connecting the thermal pads or via structure to the plane.

## Solder Masking

Solder masking of the via holes on the top layer of the PCB plugs the via holes, inhibiting solder flow into the holes. To minimize the formation of solder voids due to solder flowing into the via holes (solder wicking), via diameter should be made small, and an optional solder mask can be used. To optimize the thermal pad coverage when using the solder mask, its diameter should be no more than 0.1 mm larger than the via hole diameter.

Pads are set by customer's PCB design rules.
Thermal via Holes-Circular mask, centered on the via holes. Diameter of the mask should be 0.1 mm larger than the via hole diameter.
