

**FEATURES**

Internally matched to 50  $\Omega$  input and output

Internally biased

Operating frequency: 700 MHz to 1000 MHz

Gain: 20 dB

OIP3: 45 dBm

P1 dB: 27 dBm

Noise figure: 5 dB

3 mm  $\times$  3 mm LFCSP

Power supply: 5 V

**APPLICATIONS**

CDMA2000, WCDMA, and GSM base station transceivers and high power amplifiers

**FUNCTIONAL BLOCK DIAGRAM**

Figure 1.

06957-001

**GENERAL DESCRIPTION**

The [ADL5322](#) is a high linearity GaAs driver amplifier that is internally matched to 50  $\Omega$  for operation in the 700 MHz to 1000 MHz frequency range. The amplifier, which has a gain of 20 dB, is specially designed for use in the output stage of a cellular base station radio or as an input preamplifier in a multicarrier base station power amplifier. Matching and biasing are all on-chip. The [ADL5322](#) is available in a Pb-free, 3 mm  $\times$  3 mm, 8-lead LFCSP package with an operating temperature from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ .

## ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Supply Voltage, VPOS	6 V
Input Power (re: 50 $\Omega$ )	18 dBm
Equivalent Voltage	1.8 V rms
$\theta_{JC}$ (Soldered)	28.5°C/W
Maximum Junction Temperature	150°C
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-65°C to +150°C
Soldering Temperature	260°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

## NOTES

- CONNECT THE EXPOSED PADDLE TO THE GROUND PLANE VIA A LOW IMPEDANCE PADDLE.

06057-002

Figure 2. Pin Configuration

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1, 2, 5	VCC	Positive 5 V Supply Voltage. Bypass these three pins with independent power supply decoupling networks (100 pF, 10 nF, and 10 $\mu$ F).
3, 6, 7	GND	Device Ground.
4	RFOUT	RF Output. Internally matched to 50 $\Omega$ .
8	RFIN	RF Input. Internally matched to 50 $\Omega$ .
N/A	EP	Exposed Paddle. Connect to the ground plane via a low impedance path.

Table 4. S-Parameters

### BASIC CONNECTIONS

Figure 15 shows the basic connections for operating the ADL5322. Each of the three power supply lines should be decoupled with 10  $\mu$ F, 10 nF, and 100 pF capacitors. Pin 3, Pin 6, Pin 7, and the exposed paddle under the device should all be connected to a low impedance ground plane. If multiple ground planes are being used, these should be stitched together with vias under the device to optimize thermal conduction. See recommended land pattern in Figure 13.

Figure 13. Recommended Land Pattern

### CDMA2000 DRIVING APPLICATION

Figure 14 shows a plot of the spectrum of an ADL5322 driving at 4-carrier CDMA2000 signal at 0 dBm per carrier (total carrier power = 6 dBm), centered at 880 MHz. At 750 kHz and 1.98 MHz offset, adjacent channel power ratios of -59 dBc and -84 dBc (measured in 30 kHz with respect to the 1.22 MHz carrier) are observed. At 4 MHz carrier offset, -73 dBc is measured in a 1 MHz bandwidth (-133 dBm/Hz). Note that the spectrum of the four carriers is slightly rounded due to the frequency response of the cavity-tuned filter that was used to filter out the noise and distortion of the source signal.

Figure 14. Spectrum of 4 Adjacent CDMA2000 Carriers Centered at 880 MHz; Total Carrier Power = 6 dBm (0 dBm per Carrier)

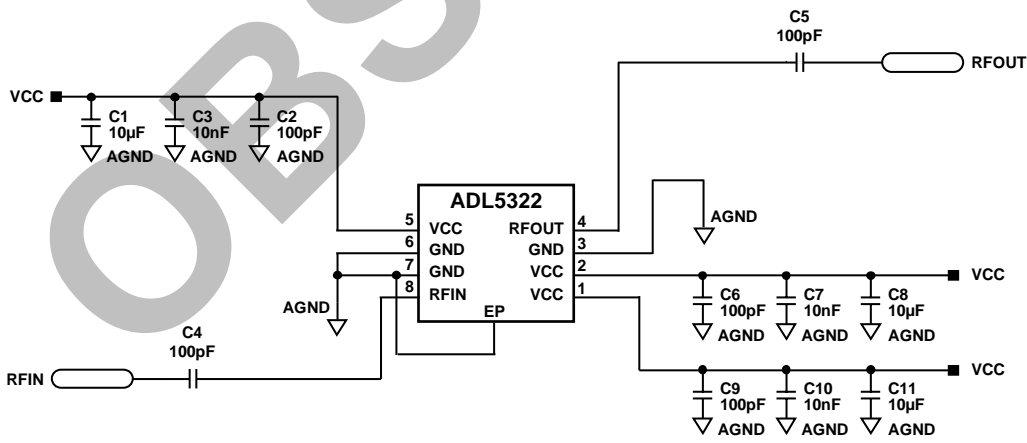

Figure 15. Basic Connections

Figure 16 shows how ACP varies with output power level. The close-in ACP is a function of the signal coding and is unaffected by output headroom at these power levels. The ACP measured at 1.98 MHz carrier offset is -72 dBc at 10 dBm output power (12 dB below the required 60 dBc). At 4 MHz carrier offset, the noise and distortion measured in a 1 MHz bandwidth is -75 dBm at 6 dBm (total) output power (0 dBm per carrier). In a 50 dBm transmitter, this corresponds to an antenna-referred output power of -31 dBm (1 MHz), which is 18 dB below what is required by the CDMA2000 standard.

Figure 16. CDMA2000 ACP vs. Output Power per Carrier; 4 Adjacent Carriers

### EVALUATION BOARD

Figure 18 shows the schematic of the **ADL5322** evaluation board. The board is powered by a single supply in the 4.75 V to 5.25 V range. The power supply is decoupled on each of the three power supply pins by 10  $\mu$ F, 10 nF, and 100 pF capacitors. See Table 5 for exact evaluation board component values. Note that all three VCC pins (Pin 1, Pin 2, and Pin 5) should be independently bypassed as shown in Figure 18 for proper operation.

Figure 17. Evaluation Board Component Side View

Table 5. Evaluation Board Components

Component	Function	Default Value
DUT1	Driver amplifier	ADL5322
C1, C12, C16	Low frequency bypass capacitors	10 $\mu$ F, 0603
C3, C11, C17	Low frequency bypass capacitors	10 nF, 0402
C2, C10, C18	High frequency bypass capacitors	100 pF, 0402
C8, C9, C13, C14, R3	Open	Open, 0402
R2, R4	AC coupling capacitors	100 pF, 0402
