Figure 2.

## GENERAL DESCRIPTION

The ADM1490E/ADM1491E are RS-485/RS-422 transceivers with $\pm 8 \mathrm{kV}$ ESD protection and are suitable for high speed, fullduplex communication on multipoint transmission lines. In particular, the ADM1490E/ADM1491E are designed for use in motor control applications requiring communications at data rates up to 16 Mbps .

The ADM1490E/ADM1491E are designed for balanced transmission lines and comply with TIA/EIA-485-A-98. The devices each have a $12 \mathrm{k} \Omega$ receiver input impedance for unit load RS-485 operation, allowing up to 32 nodes on the bus.

The differential transmitter outputs and receiver inputs feature electrostatic discharge circuitry that provides protection to $\pm 8 \mathrm{kV}$ using the human body model (HBM).
The ADM1490E/ADM1491E operate from a single 5 V power supply. Excessive power dissipation caused by bus contention or output shorting is prevented by short-circuit protection and thermal circuitry. Short-circuit protection circuits limit the

[^0]maximum output current to $\pm 250 \mathrm{~mA}$ during fault conditions. A thermal shutdown circuit senses if the die temperature rises above $150^{\circ} \mathrm{C}$ and forces the driver outputs into a high impedance state under this condition.

The receiver of the ADM1490E/ADM1491E contains a fail-safe feature that results in a logic high output state if the inputs are unconnected (floating).

The ADM1490E/ADM1491E feature extremely fast and closely matched switching times. Minimal driver propagation delays permit transmission at data rates up to 16 Mbps , and low skew minimizes EMI interference.

The ADM1490E/ADM1491E are fully specified over the commercial and industrial temperature ranges. The ADM1490E is available in two packages: a narrow body, 8-lead SOIC and an 8 -lead MSOP. The ADM1491E is also available in two packages: a narrow body, 14-lead SOIC and a 10 -lead MSOP.

## SPECIFICATIONS

$4.75 \mathrm{~V} \leq \mathrm{V}_{\mathrm{cc}} \leq 5.25 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted. All typical specifications are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V}$, unless otherwise noted.

Table 1.

| Parameter | Symbol | Min | Typ | Max | Unit | Test Conditions/Comments |

## ADM1490E/ADM1491E

## ABSOLUTE MAXIMUM RATINGS

$\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.
Table 3.

| Parameter | Rating |
| :--- | :--- |
| Vcc to GND | -0.3 V to +7 V |
| Digital I/O Voltage (DE, $\overline{\mathrm{RE})}$ | -0.3 V to $\mathrm{V} \mathrm{cc}+0.3 \mathrm{~V}$ |
| Driver Input Voltage (DI) | -0.3 V to $\mathrm{Vcc}+0.3 \mathrm{~V}$ |
| Receiver Output Voltage (RO) | -0.3 V to $\mathrm{Vcc}+0.3 \mathrm{~V}$ |
| Driver Output/Receiver Input Voltage | -9 V to +14 V |
| $\quad$ (A, B, Y, Z) | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Operating Temperature Range | $-55^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $\pm 8 \mathrm{kV}$ |
| ESD (HBM) on $\mathrm{A}, \mathrm{B}, \mathrm{Y}$, and Z |  |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{\mathrm{JA}}$ is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 4. Thermal Resistance

| Package Type | $\boldsymbol{\theta}_{\mathrm{JA}}$ | Unit |
| :--- | :--- | :--- |
| 8-Lead SOIC | 121 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| 14-Lead SOIC | 86 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| 8-Lead MSOP | 133 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| 10-Lead MSOP | 133 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Table 5. Pin Function Descriptions

| Pin No. |  |  | Mnemonic | Description |
| :---: | :---: | :---: | :---: | :---: |
| 8-Lead SOIC, <br> 8-Lead MSOP | 14-Lead SOIC | 10-Lead MSOP |  |  |
| N/A ${ }^{1}$ | 1 | N/A ${ }^{1}$ | NC | No Connect. This pin is available on the 14-lead SOIC only. |
| 2 | 2 | 1 | RO | Receiver Output. |
| $N / A^{1}$ | 3 | 2 | $\overline{\mathrm{RE}}$ | Receiver Output Enable. A low level enables the receiver output, whereas a high level places the receiver output in a high impedance state. |
| $N / A^{1}$ | 4 | 3 | DE | Driver Output Enable. A logic high enables the differential driver outputs, $A$ and $B$, whereas a logic low places the differential driver outputs in a high impedance state. |
| 3 | 5 | 4 | DI | Driver Input. When the driver is enabled, a logic low on DI forces Pin A low and Pin B high, whereas a logic high on DI forces Pin A high and Pin B low. |
| 4 | 6 | 5 | GND | Ground. |
| N/A ${ }^{1}$ | 7 | N/A ${ }^{1}$ | GND | Ground. This pin is available on the 14-lead SOIC only. |
| N/A ${ }^{1}$ | 8 | N/A ${ }^{1}$ | NC | No Connect. This pin is available on the 14-lead SOIC only. |
| 5 | 9 | 6 | Y | Noninverting Driver Output Y. |
| 6 | 10 | 7 | Z | Inverting Driver Output Z. |
| 7 | 11 | 8 | B | Inverting Receiver Input B. |
| 8 | 12 | 9 | A | Noninverting Receiver Input A. |
| 1 | 13 | 10 | $V_{\text {cc }}$ | Power Supply ( $5 \mathrm{~V} \pm 5 \%$ ). |
| N/A ${ }^{1}$ | 14 | N/A ${ }^{1}$ | $V_{\text {cc }}$ | Power Supply ( $5 \mathrm{~V} \pm 5 \%$ ). This pin is available on the 14-lead SOIC only. |

## THEORY OF OPERATION

The ADM1490E/ADM1491E are RS-422/RS-485 transceivers that operate from a single $5 \mathrm{~V} \pm 5 \%$ power supply. The ADM1490E/ ADM1491E are intended for balanced data transmission and comply with both TIA/EIA-485-A and TIA/EIA-422-B. Each device contains a differential line driver and a differential line receiver and is suitable for full-duplex data transmission.
The input impedance of the ADM1490E/ADM1491E is $12 \mathrm{k} \Omega$, allowing up to 32 transceivers on the differential bus. A thermal shutdown circuit prevents excessive power dissipation caused by bus contention or by output shorting. This feature forces the driver output into a high impedance state if, during fault conditions, a significant temperature increase is detected in the internal driver circuitry.
The receiver contains a fail-safe feature that results in a logic high output state if the inputs are unconnected (floating).
The ADM1490E/ADM1491E feature very low propagation delay, ensuring maximum baud rate operation. The balanced driver ensures distortion-free transmission.
Another important specification is a measure of the skew between the complementary outputs. Excessive skew impairs the noise immunity of the system and increases the amount of electromagnetic interference (EMI).

## TRUTH TABLES

Table 6. Abbreviations in Truth Tables

| L | Inputs open | H |
| H | X | Z |

## ESD TRANSIENT PROTECTION SCHEME

The ADM1490E/ADM1491E use protective clamping structures on their inputs and outputs to clamp the voltage to a safe level and dissipate the energy present in ESD (electrostatic). The protection structure achieves ESD protection up to $\pm 8 \mathrm{kV}$ human body model (HBM).

## ESD Testing

Two coupling methods are used for ESD testing: contact discharge and air gap discharge. Contact discharge calls for a direct connection to the unit being tested; air gap discharge uses a higher test voltage but does not make direct contact with the unit under test. With air discharge, the discharge gun is moved toward the unit under test, developing an arc across the air gap; therefore, the term air discharge. This method is influenced by humidity, temperature, barometric pressure, distance, and rate of closure of the discharge gun. The contact discharge method, though less realistic, is more repeatable and is gaining acceptance and preference over the air gap method.
Although very little energy is contained within an ESD pulse, the extremely fast rise time, coupled with high voltages, can cause failures in unprotected semiconductors. Catastrophic destruction can occur immediately because of arcing or heating. Even if catastrophic failure does not occur immediately, the device can suffer from parametric degradation, resulting in degraded performance. The cumulative effects of continuous exposure can eventually lead to complete failure.

Figure 27. ESD Generator
I/O lines are particularly vulnerable to ESD damage. Simply touching or plugging in an I/O cable may result in a static discharge that can damage or destroy the interface product connected to the I/O port. It is, therefore, extremely important to have high levels of ESD protection on the I/O lines.
The ESD discharge can induce latch-up in the device under test. Therefore, it is important to conduct ESD testing on the I/O pins while power is applied to the device. This type of testing is more representative of a real-world I/O discharge in which the equipment is operating normally when the discharge occurs.

| ESD Test Method | Input/Output Pins | Other Pins |
| :--- | :--- | :--- |
| Human Body Model | $\pm 8 \mathrm{kV}$ | $\pm 4 \mathrm{kV}$ |

## ADM1490E/ADM1491E

## APPLICATIONS INFORMATION

## DIFFERENTIAL DATA

Differential data transmission reliably transmits data at high rates over long distances and through noisy environments. Differential transmission nullifies the effects of ground shifts and noise signals that appear as common-mode voltages on the line. There are two main standards approved by the Electronics Industries Association (EIA) that specify the electrical characteristics of transceivers used in differential data transmission.

The RS-422 standard specifies data rates of up to 10 MBaud and line lengths of up to 4000 feet. A single driver can drive a transmission line with as many as 10 receivers.
The RS-485 standard addresses true multipoint communications. This standard meets or exceeds all of the requirements of RS-422, and it allows as many as 32 drivers and 32 receivers to connect to a single bus. An extended common-mode range of -7 V to +12 V is defined. The most significant difference between the RS-422 and the RS-485 is that the drivers with RS-485 can be disabled, allowing more than one driver to be connected to a single line, with as many as 32 drivers connected to a single line. Only one driver should be enabled at a time, but the RS-485 standard contains additional specifications to guarantee device safety in the event of line contention.

## CABLE AND DATA RATE

Twisted pair is the transmission line of choice for RS-485 communications. Twisted pair cable tends to cancel commonmode noise and causes cancellation of the magnetic fields generated by the current flowing through each wire, thereby reducing the effective inductance of the pair.
An RS-485 transmission line can have as many as 32 transceivers on the bus. Only one driver can transmit at a time, but multiple receivers may be enabled simultaneously.
As with any transmission line, it is important to minimize reflections. This can be achieved by terminating the extreme ends of the line using resistors equal to the characteristic impedance of the line. Keep stub lengths of the main line as short as possible. A properly terminated transmission line appears purely resistive to the driver.

## TYPICAL APPLICATIONS

Figure 29 shows a typical configuration for a full-duplex point-to-point application using the ADM1490E. Figure 30 shows a typical configuration for a full-duplex multipoint application using the ADM1491E. To minimize reflections, the lines must be terminated at the receiving end in its characteristic impedance, and stub lengths off the main line must be kept as short as possible.
