## ADM3483E/ADM3486E/ADM3488E/ADM3490E/ADM3491E

## FEATURES

TIA/EIA RS-485/RS-422 compliant
$\pm 15$ kV ESD protection on RS-485 input/output pins
Data rates
ADM3483E/ADM3488E: 250 kbps
ADM3486E: 2.5 Mbps
ADM3490E/ADM3491E: 12 Mbps
Half- and full-duplex options
Up to 32 nodes on the bus
Receiver open-circuit, fail-safe design
Low power shutdown current
(ADM3483E/ADM3486E/ADM3491E only)
Outputs high-Z when disabled or powered off
Common-mode input range: $-\mathbf{7 V}$ to +12 V
Thermal shutdown and short-circuit protection
Industry-standard 75176 pinout
8-lead and 14-lead narrow SOIC packages

## APPLICATIONS

Power/energy metering
Telecommunications
EMI-sensitive systems
Industrial control
Local area networks

## GENERAL DESCRIPTION

The ADM3483E/ADM3486E/ADM3488E/ADM3490E/ ADM3491E are 3.3 V , low power data transceivers with $\pm 15 \mathrm{kV}$ ESD protection suitable for full- and half-duplex communication on multipoint bus transmission lines. They are designed for balanced data transmission, and they comply with TIA/EIA standards RS-485 and RS-422. The ADM3483E/ADM3486E are half-duplex transceivers that share differential lines and have separate enable inputs for the driver and receiver. The full-duplex ADM3488E/ ADM3490E/ADM3491E transceivers have dedicated differential line driver outputs and receiver inputs. The ADM3491E also features separate enable inputs for the driver and receiver.
The devices have a $12 \mathrm{k} \Omega$ receiver input impedance, which allows up to 32 transceivers on a bus. Because only one driver should be enabled at any time, the output of a disabled or powered-down driver is tristated to avoid overloading the bus.

## ADM3483E/ADM3486E/ADM3488E/ADM3490E/ADM3491E

## GENERAL DESCRIPTION

(continued from Page 1)
The driver outputs of the ADM3483E/ADM3486E/ ADM3488E are slew rate limited, in order to reduce EMI and data errors caused by reflections from improperly terminated buses. The receiver has a fail-safe feature that ensures a logic high output when the inputs are floating.

Excessive power dissipation caused by bus contention or by output shorting is prevented with a thermal shutdown circuit.
The parts are fully specified over the industrial temperature range and are available in 8-lead and 14-lead narrow SOIC packages.

Table 1. Selection Table

| Part No. | Guaranteed Data <br> Rate (Mbps) | Supply <br> Voltage (V) | Half/Full <br> Duplex | Slew Rate <br> Limited | Driver/Receiver <br> Enable | $\pm \mathbf{1 5}$ kV ESD Protection <br> on Bus Pins | Pin Count |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| $\quad$ 8-Lead SOIC_N | $158^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\quad$ 14-Lead SOIC_N | $120^{\circ} \mathrm{C} / \mathrm{W}$ |
| Lead Temperature, Soldering (20 sec) | $260^{\circ} \mathrm{C}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

|  | ESD (electrostatic discharge) sensitive device. <br> Charged devices and circuit boards can discharge <br> without detection. Although this product features <br> patented or proprietary protection circuitry, damage <br> may occur on devices subjected to high energy ESD. <br> Therefore, proper ESD precautions should be taken to <br> avoid performance degradation or loss of functionality. |

## ADM3483E/ADM3486E/ADM3488E/ADM3490E/ADM3491E

## CIRCUIT DESCRIPTION

The ADM34xxE are low power transceivers for RS-485 and RS-422 communications. The ADM3483E/ADM3488E operate at data rates up to 250 kbps . The ADM3486E operates at data rates up to 2.5 Mbps , and the ADM3490E/ADM3491E transmit at up to 12 Mbps. The ADM3488E/ADM3490E/ADM3491E are fullduplex transceivers, and the ADM3483E/ADM3486E are half duplex. Driver enable (DE) and receiver enable ( $\overline{\mathrm{RE}}$ ) pins are included on the ADM3483E/ADM3486E/ADM3491E. When disabled, the driver and receiver outputs are high impedance.

LOW POWER SHUTDOWN MODE—ADM3483E/ ADM3486E/ADM3491E

The ADM3483E/ADM3486E/ADM3491E are put into a low power shutdown mode by bringing both $\overline{\mathrm{RE}}$ high and DE low. The devices do not shut down unless both the driver and the receiver are disabled (high impedance). In shutdown mode, the devices typically draw less than $1 \mu \mathrm{~A}$ of supply current. For these devices, the tpsh and the tpsL enable times assume the part was in the low power shutdown mode; the $t_{\text {pzH }}$ and the $t_{\text {PZL }}$ enable times assume the receiver or the driver was disabled, but the part was not shut down.

## DRIVER OUTPUT PROTECTION

The ADM34xxE family implements two ways to prevent excessive output current and power dissipation caused by faults or by bus contention. A current limit on the output stage provides immediate protection against short circuits over the whole common-mode voltage range (see the Typical Performance Characteristics section). In addition, a thermal shutdown circuit forces the driver outputs into a high impedance state if the die temperature rises excessively.

## PROPAGATION DELAY

Figure 11, Figure 14, Figure 26, and Figure 27 show the typical propagation delays. Skew time is simply the difference between the low-to-high and the high-to-low propagation delays. Small driver/receiver skew times help maintain a symmetrical markspace ratio ( $50 \%$ duty cycle).
The receiver skew time, $\left|t_{\text {PrHL }}-t_{\text {PrHL }}\right|$, is under $10 \mathrm{~ns}(20 \mathrm{~ns}$ for the ADM3483E/ADM3488E). The driver skew time is 8 ns for the ADM3490E/ADM3491E, 12 ns for the ADM3486E, and typically under 50 ns for the ADM3483E/ADM3488E.

## LINE LENGTH VS. DATA RATE

The RS-485/RS-422 standard covers line lengths up to 4000 feet. For line lengths greater than 4000 feet, Figure 34 illustrates an example of a line repeater.

## $\pm 15$ kV ESD PROTECTION

Two coupling methods are used for ESD testing: contact discharge and air-gap discharge. Contact discharge calls for a direct connection to the unit being tested. Airgap discharge uses a higher test voltage but does not make direct contact with the test unit. With air-gap discharge, the discharge gun is moved toward the unit under test, developing an arc across the air gap, therefore the term airgap discharge. This method is influenced by humidity, temperature, barometric pressure, distance, and rate of closure of the discharge gun. The contact discharge method, while less realistic, is more repeatable and is gaining acceptance and preference over the airgap method.
Although very little energy is contained within an ESD pulse, the extremely fast rise time, coupled with high voltages, can cause failures in unprotected semiconductors. Catastrophic destruction can occur immediately as a result of arcing or heating. Even if catastrophic failure does not occur immediately, the device can suffer from parametric degradation that can result in degraded performance. The cumulative effects of continuous exposure can eventually lead to complete failure.
Input/output lines are particularly vulnerable to ESD damage. Simply touching or connecting an input/output cable can result in a static discharge that can damage or completely destroy the interface product connected to the input/output port. It is extremely important, therefore, to have high levels of ESD protection on the input/output lines.

The ESD discharge can induce latch-up in the device under test, so it is important that ESD testing on the input/output pins be carried out while device power is applied. This type of testing is more representative of a real-world input/output discharge, which occurs when the equipment is operating normally.

The transmitter outputs and receiver inputs of the ADM34xxE family are characterized for protection to a $\pm 15 \mathrm{kV}$ limit using the human body model.

## HUMAN BODY MODEL

Figure 30 shows the human body model and the current waveform it generates when discharged into a low impedance. This model consists of a 100 pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a $1.5 \mathrm{k} \Omega$ resistor.

Figure 30. Human Body Model and Current Waveform

## TYPICAL APPLICATIONS

The ADM3483E/ADM3486E/ADM3491E transceivers are designed for bidirectional data communications on multipoint bus transmission lines. The ADM3488E/ADM3490E full-duplex transceiver is designed to be used in a daisy-chain network topology or in a point-to-point application (see Figure 32). The ADM3483E/ADM3486E are half-duplex RS-485 transceivers that can be used in a multidrop bus configuration, as shown in Figure 31. The ADM3488E/ADM3490E/ADM3491E can also be used as a line repeater, for use with cable lengths longer than 4000 feet, as shown in Figure 34. To minimize reflections, the line must be terminated at both ends in its characteristic impedance, and stub lengths off the main line should be kept as short as possible.
