## Data Sheet

## FEATURES

Ultrawideband frequency range: $9 \mathbf{k H z}$ to $\mathbf{3 0} \mathbf{~ G H z}$
Nonreflective $50 \Omega$ design
Low insertion loss: $\mathbf{2 . 0 ~ d B}$ to $\mathbf{3 0 ~ G H z}$
High isolation: $\mathbf{6 0 ~ d B}$ to $\mathbf{3 0} \mathbf{~ G H z}$
High input linearity
1 dB power compression ( P 1 dB ): $\mathbf{2 8} \mathbf{d B m}$ typical
Third-order intercept (IP3): 52 dBm typical
High power handling
24 dBm through path
24 dBm terminated path
ESD sensitivity: Class $\mathbf{1 , 1} \mathbf{k V}$ human body model (HBM)
20-terminal, $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ land grid array package
No low frequency spurious
Radio frequency (RF) settling time (to 0.1 dB of final RF
output): $6.2 \mu \mathrm{~s}$

## APPLICATIONS

## Test instrumentation

Microwave radios and very small aperture terminals (VSATs)
Military radios, radars, electronic counter measures (ECMs)
Broadband telecommunications systems

## GENERAL DESCRIPTION

The ADRF5021 is a general-purpose single-pole, double-throw (SPDT) switch manufactured using a silicon process. It comes in a $3 \mathrm{~mm} \times 3 \mathrm{~mm}, 20$-terminal land grid array (LGA) package and provides high isolation and low insertion loss from 9 kHz to 30 GHz .

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

This broadband switch requires dual supply voltages, +3.3 V and -2.5 V , and provides CMOS/LVTTL logic-compatible control.

[^0]
## ABSOLUTE MAXIMUM RATINGS

For recommended operating conditions, see Table 1.
Table 2.

| Parameter | Rating |
| :---: | :---: |
| Supply Voltage |  |
| Positive | -0.3 V to +5.5 V |
| Negative | -2.75 V to +0.3 V |
| Digital Control Inputs ${ }^{1}$ | -0.3 V to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ or 3.3 mA , whichever occurs first |
| $\begin{aligned} & \text { RF Input Power² (f = } 1 \mathrm{MHz} \text { to } 30 \mathrm{GHz}, \\ & \left.\mathrm{~T}_{\text {cass }}\right)=85^{\circ} \mathrm{C} \text { ) } \end{aligned}$ |  |
| Through Path | 27 dBm |
| Terminated Path | 25 dBm |
| Hot Switching | 21 dBm |
| Temperature |  |
| Junction ( $\mathrm{T}_{\text {J }}$ ) | $135^{\circ} \mathrm{C}$ |
| Storage | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Reflow (MSL3 Rating) | $260^{\circ} \mathrm{C}$ |
| Junction to Case Thermal Resistance$\text { ( } \theta_{\mathrm{Jc}} \text { ) }$ |  |
| Through Path | $420^{\circ} \mathrm{C} / \mathrm{W}$ |
| Terminated Path | $160^{\circ} \mathrm{C} / \mathrm{W}$ |
| ESD Sensitivity |  |
| HBM | 1 kV (Class 1) |

${ }^{1}$ Overvoltages at digital control inputs are clamped by internal diodes. Current must be limited to the maximum rating given.
${ }^{2}$ For power derating at frequencies less than 1 MHz , see Figure 2 to Figure 4.
Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.
Only one absolute maximum rating can be applied at any one time.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Table 3. Pin Function Descriptions

| Pin No. | Mnemonic | Description |
| :---: | :---: | :---: |
| $\begin{aligned} & 1,2,4 \text { to } 7,9,10 \\ & 13,16,17,19,20 \end{aligned}$ | GND | Ground. These pins must be connected to the RF/dc ground of the printed circuit board (PCB). |
| 3 | RFC | RF Common Port. This pin is dc-coupled to 0 V and ac matched to $50 \Omega$. No dc blocking capacitor is necessary when the RF line potential is equal to 0 V dc. See Figure 6 for the interface schematic. |
| 8 | RF1 | RF1 Port. This pin is dc-coupled to 0 V and ac matched to $50 \Omega$. No dc blocking capacitor is necessary when the RF line potential is equal to 0 V dc . See Figure 6 for the interface schematic. |
| 11 | VDD | Positive Supply Voltage. |
| 12 | CTRL | Control Input. See Figure 7 for the interface schematic. |
| 14 | EN | Enable Input. See Figure 7 for the interface schematic. |
| 15 | VSS | Negative Supply Voltage. |
| 18 | RF2 EPAD | RF2 Port. This pin is dc-coupled to 0 V and ac matched to $50 \Omega$. No dc blocking capacitor is necessary when the RF line potential is equal to 0 V dc. See Figure 6 for the interface schematic. Exposed Pad. The exposed pad must be connected to the RF/dc ground of the PCB. |

## INTERFACE SCHEMATICS

Figure 7. Digital Pins (CTRL and EN) Interface Schematic

## TYPICAL PERFORMANCE CHARACTERICS

## INSERTION LOSS, RETURN LOSS, AND ISOLATION

Insertion loss and return loss measured on the probe matrix board using the ground, signal, ground (GSG) probes close to the RF pins; isolation measured on an evaluation board because signal coupling between the probes limits the isolation performance of the ADRF5021 on the probe matrix board (see the Applications Information section for details of evaluation and probe matrix boards).

## THEORY OF OPERATION

The ADRF5021 requires a positive supply voltage applied to the VDD pin and a negative supply voltage applied to the VSS pin. Bypassing capacitors are recommended on the supply lines to minimize RF coupling.
The ADRF5021 is internally matched to $50 \Omega$ at the RF common port (RFC) and the RF throw ports (RF1 and RF2); therefore, no external matching components are required. All of the RF ports are dc-coupled to 0 V , and no dc blocking is required at the RF ports when the RF line potential is equal to 0 V . The design is bidirectional; the RF input signal can be applied to the RFC port while the RF throw port (RF1 or RF2) is output or vice versa.
The ADRF5021 incorporates a driver to perform logic functions internally and to provide the user with the advantage of a simplified control interface. The driver features two digital control input pins, CTRL and EN.
When the EN pin is logic low, the RF1 to RFC path is in an insertion loss state, and the RF2 to RFC path is in an isolation state, or vice versa, depending on the logic level applied to the CTRL pin. The insertion loss path (for example, RF1 to RFC) conducts the RF signal equally well in both directions between its throw port (for example, RF1) and common port (RFC). The isolation path (for example, RF2 to RFC) provides high loss between the insertion loss path and its throw port (for example, RF2) terminated to an internal $50 \Omega$ resistor.

When the EN pin is logic high, both the RF1 to RFC path and the RF2 to RFC path are in an isolation state regardless of the logic state of CTRL. RF1 and RF2 ports are terminated to internal $50 \Omega$ resistors, and RFC becomes open reflective.
The ideal power-up sequence is as follows:

1. Connect GND.
2. Power up VDD and VSS. Powering up VSS after VDD avoids current transients on VDD during ramp-up.
3. Apply the digital control inputs, CTRL and EN. Applying the digital control inputs before the VDD supply may inadvertently forward bias and damage the internal ESD protection structures. In such a case, use a series $1.5 \mathrm{k} \Omega$ resistor to limit the current flowing in to the control pin. If the control pins are not driven to a valid logic state (for example, if the controller output is in a high impedance state) after VDD is powered up, it is recommended to use pull-up and pull-down resistors.
4. Apply an RF input signal.

The ideal power-down sequence is the reverse order of the power-up sequence.

Table 4. Control Voltage Truth Table

| Digital Control Input |  | RF Paths |  |
| :--- | :--- | :--- | :--- |
| EN | CTRL | RF1 to RFC | RF2 to RFC |
| Low | Low | Isolation (off) | Insertion loss (on) |
| Low | High | Insertion loss (on) | Isolation (off) |
| High | Low | Isolation (off) | Isolation (off) |
| High | High | Isolation (off) | Isolation (off) |

## APPLICATIONS INFORMATION EVALUATION BOARD

Figure 18 and Figure 19 show the top and cross sectional views of the evaluation board, which uses 4-layer construction with a copper thickness of $0.5 \mathrm{oz}(0.7 \mathrm{mil})$ and dielectric materials between each copper layer.

Figure 18. Evaluation Board Layout (Top View)

Figure 19. Evaluation Board (Cross Sectional View)
All RF and dc traces are routed on the top copper layer whereas the inner and bottom layers are grounded planes that provide a solid ground for the RF transmission lines. Top dielectric material is 8 mil Rogers RO4003, offering good high frequency performance. The middle and bottom dielectric materials are FR-4 type materials to achieve an overall board thickness of 62 mil.
The RF transmission lines were designed using a coplanar waveguide (CPWG) model with a width of 14 mil and ground spacing of 5 mil to have a characteristic impedance of $50 \Omega$. For good RF and thermal grounding, as many plated through vias as possible are arranged around transmission lines and under the exposed pad of the package.

Figure 20 shows the actual ADRF5021 evaluation board with component placement. Two power supply ports are connected to the VDD and VSS test points, TP5 and TP2, and the ground reference is connected to the GND test point, TP1. On each supply trace, a 100 pF bypass capacitor is used, and unpopulated components positions are available for applying extra bypass capacitors.

Figure 20. Populated Evaluation Board
Two control ports are connected to the EN and CTRL test points, TP3 and TP4. On each control trace, a resistor position is available to improve the isolation between the RF and control signals. The RF ports are connected to the RFC, RF1, and RF2 connectors (J1, J2, and J3) that are end launch 2.4 mm RF connectors. A through transmission line that connects unpopulated RF connectors (J7 and J8) is also available to measure the loss of the PCB. Figure 21 and Table 5 are the evaluation board schematic and bill of materials, respectively.

The evaluation board shown in Figure 20 is available from Analog Devices, Inc., upon request.

Figure 21. Evaluation Board Schematic

Table 5. Bill of Materials, Evaluation Board Components

| Component | Description |
| :--- | :--- |
| J1, J2, J3 | End launch connectors, 2.4 mm |
| J7, J8 | Unpopulated end launch connectors, 2.4 mm |
| TP1 to TP5 | Through hole mount test points |
| C4, C5 | 100 pF capacitors, 0402 package |
| C2, C3 | Unpopulated capacitors, 0402 package |
| C1, C6 | Unpopulated capacitors, 0603 package |

## PROBE MATRIX BOARD

Figure 22 and Figure 23 show the top and cross sectional views of the probe matrix board that measures the s-parameters of the ADRF5021 at close proximity to RF pins using the GSG probes. The actual board duplicates the same layout in matrix form to assemble multiple devices and uses RF traces for through, reflect, and line (TRL) calibration.
