## Data Sheet

## FEATURES

## Reflective, $50 \Omega$ design

Low insertion loss
0.6 dB typical to 2.0 GHz
0.7 dB typical to 3.5 GHz

High isolation
50 dB typical to 2.0 GHz
46 dB typical to 3.5 GHz
High power handling
RF input power, continuous wave (CW) at $\mathrm{T}_{\text {CASE }}=85^{\circ} \mathrm{C}$
43 dBm maximum operating
46.5 dBm absolute maximum rating

High linearity
0.1 dB compression ( P 0.1 dB ): $\mathbf{4 6 ~ d B m}$ typical

Input third-order intercept (IP3)
68 dBm typical to $2 \mathbf{~ G H z}$
65 dBm typical to 3.5 GHz
ESD ratings
Human body model (HBM): 2 kV, Class 2
Charged device model (CDM): 1.25 kV
Single positive supply: $\mathrm{V}_{\mathrm{DD}}=5 \mathrm{~V}$
Positive control, TTL-compatible: $\mathrm{V}_{\text {ctL }}=\mathbf{0} \mathrm{V}$ or $\mathrm{V}_{\mathrm{DD}}$
24-lead, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ LFCSP package ( $16 \mathrm{~mm}^{2}$ )

## APPLICATIONS

## Cellular/4G infrastructure

## Wireless infrastructure

Military and high reliability applications
Test equipment
Pin diode replacement

## GENERAL DESCRIPTION

The ADRF5130 is a high power, reflective, 0.7 GHz to 3.8 GHz , silicon, single-pole, double-throw (SPDT) switch in a leadless, surface-mount package. The switch is ideal for high power and cellular infrastructure applications, like long-term evolution (LTE) base stations.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

The ADRF5130 has high power handling of 43 dBm (maximum) and 0.1 dB compression ( P 0.1 dB ) of 46 dBm , with a low insertion loss of 0.6 dB at 2 GHz and 0.7 dB at 3.5 GHz . On-chip circuitry operates at a single, positive supply voltage of 5 V and typical supply current of 1.06 mA , making the ADRF5130 an ideal alternative to pin diode-based switches.
The device comes in a RoHS compliant, compact, 24-lead, $4 \mathrm{~mm} \times$ 4 mm LFCSP package.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

| Parameter | Rating |
| :--- | :--- |
| Bias Voltage Range (VDD) | -0.3 V to +5.5 V |
| Control Voltage Range (VCTL) | -0.3 V to +5.5 V |
| RF Input Power, Continuous Wave | 46.5 dBm |
| Channel Temperature | $135^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ |
| Peak Reflow Temperature (MSL3) ${ }^{2}$ | $260^{\circ} \mathrm{C}$ |
| Thermal Resistance (Channel to Package | $17^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\quad$ Bottom) |  |
| Electrostatic Discharge (ESD) Sensitivity | $2 \mathrm{kV}(\mathrm{Class} 2)$ |
| $\quad$ HBM | 1.25 kV |
| CDM |  |

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## ESD CAUTION

|  | ESD (electrostatic discharge) sensitive device. <br> Charged devices and circuit boards can discharge <br> without detection. Although this product features <br> patented or proprietary protection circuitry, damage <br> may occur on devices subjected to high energy ESD. <br> Therefore, proper ESD precautions should be taken to <br> avoid performance degradation or loss of functionality. |

## THEORY OF OPERATION

The ADRF5130 requires a single-supply voltage applied to the $V_{\text {DD }}$ pin. Bypass capacitors are recommended on the supply line to minimize RF coupling.
A digital control voltage applied to the $V_{\text {CTL }}$ pin controls the ADRF5130. A small bypassing capacitor is recommended on these digital signal lines to improve the RF signal isolation.

The ADRF5130 is internally matched to $50 \Omega$ at the RF input port (RFC) and the RF output ports (RF1 and RF2); therefore, no external matching components are required. The RFx pins are dc-coupled, and dc blocking capacitors are required on the RF lines. The design is bidirectional; the input and outputs are interchangeable.

The ideal power-up sequence of the ADRF5130 is as follows:

1. Connect to GND.
2. Power up $V_{D D}$.
3. Power up the digital control input. Powering the digital control input before the $V_{D D}$ supply can inadvertently forward-bias and damage the ESD protection structures.
4. Power up the RF input. Depending on the logic level applied to the $\mathrm{V}_{\text {CTL }}$ pin, one RF output port (for example, RF1) is set to on mode, by which an insertion loss path is provided from the input to the output, while the other RF output port (for example, RF2) is set to off mode, by which the output is isolated from the input.

Table 5. Switch Operation Mode

| Digital Control Input (VCrL) | Switch Mode |  |
| :--- | :--- | :--- |
|  | RFC to RF1 | RFC to RF2 |
| 1 | Off mode: the RF1 port is isolated from the RFC <br> port and is internally terminated to a $50 \Omega$ load to <br> absorb the applied RF signals. <br> On mode: a low insertion loss path from the RFC <br> port to the RF1 port. | On mode: a low insertion loss path from the RFC port <br> to the RF2 port. |
| Off mode: the RF2 port is isolated from the RFC port <br> and becomes open reflective. |  |  |

## APPLICATIONS INFORMATION

Generate the evaluation PCB used in the application circuit shown in Figure 11 with proper RF circuit design techniques. Signal lines at the RF port must have a $50 \Omega$ impedance, and the package ground leads and backside ground slug must connect directly to the ground plane, as shown in Figure 14.

Figure 11. Application Circuit

## EVALUATION BOARD

The ADRF5130 evaluation board has eight metal layers and dielectrics between each layer (see Figure 12). The top and the bottom metal layers have copper thickness of $2 \mathrm{oz}(2.7 \mathrm{mil})$, whereas the metal layers in between them have 1 oz copper ( 1.3 mil) thickness. The top dielectric material is 10 mil Rogers RO4350, which exhibits a very low thermal coefficient, offering control over thermal rise of the board. The dielectrics between other metal layers are FR-4. The overall board thickness achieved is 62 mil.

Figure 13 shows the top view of the ADRF5130 evaluation board.
The top copper layer has all RF and dc traces, whereas the other seven layers provide good ground and help to handle the thermal rise on the evaluation board caused by the high power of the ADRF5130. In addition, for proper thermal grounding, many via holes are provided around the transmission lines and under the exposed pad of the package. RF transmission lines on the ADRF5130 evaluation board are coplanar wave guide design with an 18 mil width and a ground spacing of 13 mil. For controlling the thermal rise of the ADRF5130 evaluation board at high temperatures and power levels, it is recommended to use a heat sink and a mini dc fan.

Figure 12. Evaluation Board Cross-Sectional View

Figure 13. Evaluation Board Top View

Figure 14 shows the ADRF5130 evaluation board with all components populated. The VDD supply port connects to TP1. The VDD supply trace has three bypass capacitors $100 \mathrm{pF}, 1 \mu \mathrm{~F}$, and 1 nF . The TP2 test point connects to the control voltage port (VCTL). The control trace has a 100 pF bypass capacitor and $0 \Omega$ resistor. The ground reference connects to GND. A 100 pF dc blocking capacitor is used on all RF traces that connect the RF1, RF2, and RFC ports to the J1, J2, and J3 connectors,
respectively. The connectors used are 2.9 mm end launch SMA connectors. Unpopulated capacitor positions are available on all RF traces to provide extra matching. A through transmission line (THRU CAL) is available on the ADRF5130 evaluation board that can measure board loss on the printed circuit board (PCB).

Table 6 shows the bill of materials for the ADRF5130 evaluation board. The evaluation board shown in Figure 14 is available from Analog Devices, Inc., upon request.
