Dual-Channel, 3.7 GHz to 5.3 GHz, Receiver Front End

Data Sheet **ADRF5547**

FEATURES

- Integrated dual-channel RF front end
  - 2-stage LNA and high power SPDT switch
  - On-chip bias and matching
  - Single-supply operation
- Gain
  - High gain mode: 33 dB typical at 4.6 GHz
  - Low gain mode: 18 dB typical at 4.6 GHz
- Low noise figure
  - High gain mode: 1.6 dB typical at 4.6 GHz
  - Low gain mode: 1.6 dB typical at 4.6 GHz
- High channel to channel isolation
  - Between RxOUT-ChA and RxOUT-ChB: 45 dB typical
  - Between TERM-ChA and TERM-ChB: 53 dB typical
- Low insertion loss: 0.50 dB typical at 4.6 GHz
- High power handling at T_{CASE} = 105°C
  - Full lifetime
    - LTE average power (9 dB PAR): 40 dBm
  - Single event (<10 sec operation)
    - LTE average power (9 dB PAR): 43 dBm
- High OIP3: 31 dBm typical
- Power-down mode and low gain mode for LNA
- Low supply current
  - High gain mode: 86 mA typical at 5 V
  - Low gain mode: 36 mA typical at 5 V
  - Power-down mode: 12 mA typical at 5 V
- Positive logic control
- 40-lead, 6 mm × 6 mm LFCSP

APPLICATIONS

- Wireless infrastructure
- TDD massive multiple input and multiple output (MIMO) and active antenna systems
- TDD-based communication systems

GENERAL DESCRIPTION

The ADRF5547 is a dual-channel, integrated RF, front end multichip module designed for time division duplexing (TDD) applications that operates from 3.7 GHz to 5.3 GHz. The ADRF5547 is configured in dual channels with a cascading two-stage low noise amplifier (LNA) and a high power silicon, single-pole, double-throw (SPDT) switch.

In high gain mode, the cascaded, two-stage LNA and switch offer a low noise figure of 1.6 dB and high gain of 33 dB at 4.6 GHz with an output third order intercept point (OIP3) of 31 dBm (typical).

In low gain mode, one stage of the two-stage LNAs is in bypass, providing 18 dB gain at lower current of 36 mA. In power-down mode, the LNAs are turned off and the device draws 12 mA.

In transmit operation, when RF inputs are connected to a termination pin (TERM-ChA or TERM-ChB), the switch provides a low insertion loss of 0.50 dB and handles long term evolution (LTE) average power (9 dB peak to average ratio (PAR)) of 40 dBm for full lifetime operation and 43 dBm for single event (<10 sec) LNA protection operation.

The device comes in an RoHS compliant, compact, 40-lead, 6 mm × 6 mm LFCSP.

[1] V_{DD} is the voltage of the VDD1-ChA, VDD1-ChB, VDD2-ChA, and VDD2-ChB pins.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operation environment. Careful attention to PCB thermal design is required.

θ_{JC} is the junction to case bottom (channel to package bottom) thermal resistance.

Table 3. Thermal Resistance

Package Type	θ_{JC}	Unit

Power-Down Mode	8.7	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

The ADRF5547 requires a positive supply voltage applied to VDD1-ChA, VDD2-ChA, VDD1-ChB, VDD2-ChB, and SWVDD-ChAB. Use bypassing capacitors on the supply lines to filter noise and use 300 Ω series resistors on the BP-Chx and PD-ChAB digital control pins for glitch and overcurrent protection.

SIGNAL PATH SELECT

When SWCTRL-ChAB is set to high, the ADRF5547 supports transmit operations. During this operation, when applying an RF input to ANT-ChA and ANT-ChB, the signal paths connect from ANT-ChA to TERM-ChA and from ANT-ChB to TERM-ChB.

When SWCTRL-ChAB is set to low, the ADRF5547 supports receive operations. During this operation, applying an RF input at ANT-ChA and ANT-ChB connects ANT-ChA to RxOUT-ChA and ANT-ChB to RxOUT-ChB.

Receive Operation

The ADRF5547 supports high gain mode, low gain mode, power-down high isolation mode, and power-down low isolation mode in receive operation, as detailed in Table 6.

When PD-ChAB is set to low, the LNA powers up and the user can select high gain mode or low gain mode. To select high gain mode, set BP-ChA or BP-ChB to low. To select low gain mode, set BP-ChA or BP-ChB to high.

When PD-ChAB is set to high, the ADRF5547 enters power-down mode. To select power-down high isolation mode, set BP-ChA or BP-ChB to low. To select power-down low isolation mode, set BP-ChA or BP-ChB to high.

BIASING SEQUENCE

To power up the ADRF5547, perform the following steps:

1. Connect GND to ground.
2. Power up VDD1-ChA, VDD2-ChA, VDD1-ChB, VDD2-ChB, and SWVDD-ChAB.
3. Power up SWCTRL-ChAB.
4. Power up PD-ChAB.
5. Power up BP-ChA and BP-ChB.
6. Apply an RF input signal to ANT-ChA and ANT-ChB.

To power down the ADRF5547, perform these steps in the reverse order.

APPLICATIONS INFORMATION

To generate the evaluation PCB used in the application circuit shown in Figure 28, use proper RF circuit design techniques. Signal lines at the RF port must have a 50 Ω impedance, and the package ground leads and the backside ground slug must connect directly to the ground plane. Use 300 Ω series resistors on the BP-Chx and PD-ChAB digital control pins for glitch and overcurrent protection.

See the ADRF5547-EVALZ user guide for additional information on the evaluation board.
