## FEATURES

Enhanced system-level ESD performance per IEC 61000-4-x Low power operation

5 V operation
1.4 mA per channel maximum at $\mathbf{0}$ Mbps to $\mathbf{2}$ Mbps
4.3 mA per channel maximum at 10 Mbps

34 mA per channel maximum at 90 Mbps
3.3 V operation
0.9 mA per channel maximum at 0 Mbps to 2 Mbps
2.4 mA per channel maximum at 10 Mbps

20 mA per channel maximum at 90 Mbps
Bidirectional communication
3.3 V/5 V level translation

High temperature operation: $105^{\circ} \mathrm{C}$
High data rate: dc to $\mathbf{9 0} \mathbf{M b p s}$ (NRZ)
Precise timing characteristics
2 ns maximum pulse width distortion
$2 \mathbf{n s}$ maximum channel-to-channel matching
High common-mode transient immunity: $\mathbf{> 2 5} \mathbf{~ k V} / \mu \mathrm{s}$
Output enable function
16-lead SOIC wide body, RoHS-compliant package
Safety and regulatory approvals
UL recognition: $\mathbf{2 5 0 0}$ V rms for 1 minute per UL 1577
CSA Component Acceptance Notice 5A
VDE Certificate of Conformity
DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12
$V_{\text {IORM }}=560 \mathrm{~V}$ peak

## APPLICATIONS

General-purpose multichannel isolation SPI/data converter isolation
RS-232/RS-422/RS-485 transceivers
Industrial field bus isolation

## GENERAL DESCRIPTION

The ADuM3400/ADuM3401/ADuM3402 ${ }^{1}$ are 4-channel digital isolators based on the Analog Devices, Inc., iCoupler ${ }^{\circledR}$ technology. Combining high speed CMOS and monolithic air core transformer technology, these isolation components provide outstanding performance characteristics superior to alternatives such as optocoupler devices.
$i$ Coupler devices remove the design difficulties commonly associated with optocouplers. Typical optocoupler concerns regarding uncertain current transfer ratios, nonlinear transfer functions, and temperature and lifetime effects are eliminated with the simple $i$ Coupler digital interfaces and stable performance characteristics. The need for external drivers and other discrete components is eliminated with these $i$ Coupler products. Furthermore, $i$ Coupler devices consume one-tenth to one-sixth the power of optocouplers at comparable signal data rates.

The isolators provide four independent isolation channels in a variety of channel configurations and data rates (see the Ordering Guide). All models operate with the supply voltage on either side ranging from 3.0 V to 5.5 V , providing compatibility with lower voltage systems as well as enabling a voltage translation functionality across the isolation barrier. The isolators have a patented refresh feature that ensures dc correctness in the absence of input logic transitions and during power-up/power-down conditions.

In comparison to the ADuM1400/ADuM1401/ADuM1402 isolators, the ADuM3400/ADuM3401/ADuM3402 isolators contain various circuit and layout changes to provide increased capability relative to system-level IEC 61000-4-x testing (ESD/ burst/surge). The precise capability in these tests for either set of isolators is strongly determined by the design and layout of the user board or module. For more information, see the AN-793 Application Note, ESD/Latch-Up Considerations with iCoupler Isolation Products.

| Common-Mode Transient Immunity at Logic High Output ${ }^{7}$ | \|CM ${ }^{\text {H }}$ | 25 | 35 |  | kV/ $/ \mathrm{s}$ | $\begin{aligned} & \mathrm{V}_{\mathrm{Ix}}=\mathrm{V}_{\mathrm{DD} 1} / \mathrm{V}_{\mathrm{DD} 2,}, \mathrm{~V}_{\mathrm{CM}}=1000 \mathrm{~V}, \\ & \text { transient magnitude }=800 \mathrm{~V} \end{aligned}$ |
| Common-Mode Transient Immunity at Logic Low Output ${ }^{7}$ | \|CML| | 25 | 35 |  | kV/ $/$ s | $\begin{aligned} & \mathrm{V}_{\mathrm{Ix}}=0 \mathrm{~V}, \mathrm{~V} \mathrm{VM}=1000 \mathrm{~V}, \\ & \text { transient magnitude }=800 \mathrm{~V} \end{aligned}$ |
| Refresh Rate | $\mathrm{fr}_{\mathrm{r}}$ |  | 1.2 |  | Mbps |  |
| Input Dynamic Supply Current per Channel ${ }^{8}$ | $\operatorname{lod}$ (D) |  | 0.20 |  | mA/Mbps |  |
| Output Dynamic Supply Current per Channel ${ }^{8}$ | IdDo (D) |  | 0.05 |  | mA/Mbps |  |

${ }^{1}$ The supply current values for all four channels are combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate can be calculated as described in the Power Consumption section. See Figure 8 through Figure 10 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 11 through Figure 15 for total $V_{D D 1}$ and $V_{D D 2}$ supply currents as a function of data rate for ADuM3400/ADuM3401/ADuM3402 channel configurations.
${ }^{2}$ The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
${ }^{3}$ The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4} t_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the $V_{I X}$ signal to the $50 \%$ level of the falling edge of the $V_{O x}$ signal. $t_{\text {PLH }}$ propagation delay is measured from the $50 \%$ level of the rising edge of the $\mathrm{V}_{1 \mathrm{x}}$ signal to the $50 \%$ level of the rising edge of the $\mathrm{V}_{0 \mathrm{x}}$ signal.
${ }^{5}$ tpsk is the magnitude of the worst-case difference in $t_{\text {PHL }}$ or tpLH that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.
${ }^{7} \mathrm{CM}_{H}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{O}}>0.8 \mathrm{~V}_{\mathrm{DD} 2}$. $\mathrm{CM}_{\mathrm{L}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{0}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.
${ }^{8}$ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 8 through Figure 10 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

## ADuM3400/ADuM3401/ADuM3402

## ELECTRICAL CHARACTERISTICS—3.3 V OPERATION

All voltages are relative to their respective ground. $3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 3.6 \mathrm{~V}, 3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 3.6 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at $T_{A}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD} 1}=\mathrm{V}_{\mathrm{DD} 2}=3.3 \mathrm{~V}$.

| Refresh Rate | $\mathrm{fr}_{\mathrm{r}}$ |  | 1.1 |  | Mbps |  |
| Input Dynamic Supply Current per Channel ${ }^{8}$ | lodi (0) |  | 0.10 |  | mA/Mbps |  |
| Output Dynamic Supply Current per Channel ${ }^{8}$ | IDDO (D) |  | 0.03 |  | mA/Mbps |  |

${ }^{1}$ The supply current values for all four channels are combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate can be calculated as described in the Power Consumption section. See Figure 8 through Figure 10 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 11 through Figure 15 for total $V_{D D 1}$ and $V_{D D 2}$ supply currents as a function of data rate for ADuM3400/ADuM3401/ADuM3402 channel configurations.
${ }^{2}$ The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
${ }^{3}$ The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4} t_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the $V_{1 X}$ signal to the $50 \%$ level of the falling edge of the $V_{\text {Ox }}$ signal. $t_{\text {PLH }}$ propagation delay is measured from the $50 \%$ level of the rising edge of the $V_{1 x}$ signal to the $50 \%$ level of the rising edge of the $V_{\text {ox }}$ signal.
${ }^{5} t_{\text {PSK }}$ is the magnitude of the worst-case difference in $t_{\text {PHL }}$ or $t_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.
${ }^{7} \mathrm{CM}_{H}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{O}}>0.8 \mathrm{~V}_{\mathrm{DD} 2}$. $\mathrm{CM}_{\mathrm{L}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{0}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.
${ }^{8}$ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 8 through Figure 10 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

## ADuM3400/ADuM3401/ADuM3402

## ELECTRICAL CHARACTERISTICS—MIXED 5 V/3.3 V OR 3.3 V/5 V OPERATION

All voltages are relative to their respective ground. $5 \mathrm{~V} / 3.3 \mathrm{~V}$ operation: $4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 5.5 \mathrm{~V}, 3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 3.6 \mathrm{~V} ; 3.3 \mathrm{~V} / 5 \mathrm{~V}$ operation: $3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 3.6 \mathrm{~V}, 4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 5.5 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C} ; \mathrm{V}_{\mathrm{DD} 1}=3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD} 2}=5 \mathrm{~V}$ or $\mathrm{V}_{\mathrm{DD} 1}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD} 2}=3.3 \mathrm{~V}$.

| $3.3 \mathrm{~V} / 5 \mathrm{~V}$ Operation |  |  | 0.05 |  | mA/Mbps |  |

${ }^{1}$ The supply current values for all four channels are combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate can be calculated as described in the Power Consumption section. See Figure 8 through Figure 10 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 11 through Figure 15 for total $V_{D D 1}$ and $V_{D D 2}$ supply currents as a function of data rate for ADuM3400/ADuM3401/ADuM3402 channel configurations.
${ }^{2}$ The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
${ }^{3}$ The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4} t_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the $\mathrm{V}_{1 \times}$ signal to the $50 \%$ level of the falling edge of the $V_{0 \times}$ signal. $t_{\text {PLH }}$ propagation delay is measured from the $50 \%$ level of the rising edge of the $\mathrm{V}_{1 \mathrm{x}}$ signal to the $50 \%$ level of the rising edge of the $\mathrm{V}_{0 \times}$ signal.
${ }^{5} t_{\text {PSK }}$ is the magnitude of the worst-case difference in $t_{\text {PHL }}$ or $t_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.
${ }^{7} \mathrm{CM}_{\mathrm{H}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{O}}>0.8 \mathrm{~V}_{\mathrm{DD} 2}$. CM L is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{0}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.
${ }^{8}$ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 8 through Figure 10 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

${ }^{1}$ Device considered a 2-terminal device; Pin 1 to Pin 8 are shorted together and Pin 9 to Pin 16 are shorted together.
${ }^{2}$ Input capacitance is from any input data pin to ground.

## REGULATORY INFORMATION

The ADuM3400/ADuM3401/ADuM3402 are approved by the organizations listed in Table 5. Refer to Table 10 and the Insulation Lifetime section for details regarding recommended maximum working voltages for specific cross-isolation waveforms and insulation levels.

Table 5.

| UL | CSA | CQC | VDE |
| :---: | :---: | :---: | :---: |
| Recognized Under 1577 Component Recognition Program ${ }^{1}$ | Approved under CSA Component Acceptance Notice 5A | Approved under CQC11-471543-2012 | Certified according to DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12² |
| Single Protection, 2500 V rms Isolation Voltage | Basic insulation per CSA 60950-1-03 and IEC 60950-1, 800 V rms (1131 V peak) maximum working voltage <br> Reinforced insulation per CSA 60950-1-03 and IEC 60950-1, 400 V rms ( 566 V peak) maximum working voltage | Basic insulation per GB4943.1-2011 400 V rms ( 588 V peak) maximum working voltage, tropical climate, altitude $\leq$ 5000 meters | Reinforced insulation, 560 V peak |
| File E214100 | File 205078 | File CQC14001117249 | File 2471900-4880-0001 |

${ }^{1}$ In accordance with UL 1577, each ADuM3400/ADuM3401/ADuM3402 is proof tested by applying an insulation test voltage $\geq 3000 \mathrm{~V}$ rms for 1 sec (current leakage detection limit $=5 \mu \mathrm{~A}$ ).
${ }^{2}$ In accordance with DIN V VDE V 0884-10, each ADuM3400/ADuM3401/ADuM3402 is proof tested by applying an insulation test voltage $\geq 1050 \mathrm{~V}$ peak for 1 sec (partial discharge detection limit $=5 \mathrm{pC}$ ). The * marking branded on the component designates DIN V VDE V 0884-10 approval.

## INSULATION AND SAFETY-RELATED SPECIFICATIONS

Table 6.

| Parameter | Symbol | Value | Unit | Conditions |
| :--- | :--- | :--- | :--- | :--- |
| Rated Dielectric Insulation Voltage | L(I01) | 2500 | V rms | 1-minute duration |

## ADuM3400/ADuM3401/ADuM3402

## ABSOLUTE MAXIMUM RATINGS

Ambient temperature $=25^{\circ} \mathrm{C}$, unless otherwise noted.
Table 9.

| Parameter | Rating |
| :---: | :---: |
| Storage Temperature Range ( $\mathrm{TsT}^{\text {) }}$ | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Ambient Operating Temperature Range ( $\mathrm{T}_{\mathrm{A}}$ ) | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ |
| Supply Voltages ( $\left.\mathrm{V}_{\mathrm{DD} 1}, \mathrm{~V}_{\mathrm{DD} 2}\right)^{1}$ | -0.5 V to +7.0 V |
| Input Voltage ( $\left.\mathrm{V}_{\mathrm{IA}}, \mathrm{V}_{13}, \mathrm{~V}_{1,}, \mathrm{~V}_{10}, \mathrm{~V}_{E 1}, \mathrm{~V}_{\mathrm{E} 2}\right)^{1,2}$ | -0.5 V to $\mathrm{V}_{\mathrm{DD} 1}+0.5 \mathrm{~V}$ |
| Output Voltage ( $\left.\mathrm{V}_{\text {OA, }}, \mathrm{V}_{\text {OB, }}, \mathrm{V}_{\text {OC, }}, \mathrm{V}_{\text {OD }}\right)^{1,2}$ | -0.5 V to $\mathrm{V}_{\text {DDO }}+0.5 \mathrm{~V}$ |
| Average Output Current per $\mathrm{Pin}^{3}$ |  |
| Side 1 ( $\mathrm{l}_{1}$ ) | -18 mA to +18 mA |
| Side 2 ( $\mathrm{lo}^{2}$ ) | -22 mA to +22 mA |
| Common-Mode Transients ( $\left.\mathrm{CM}_{\mathrm{H},} \mathrm{CM}_{\mathrm{L}}\right)^{4}$ | $\begin{aligned} & -100 \mathrm{kV} / \mu \mathrm{s} \text { to } \\ & +100 \mathrm{kV} / \mu \mathrm{s} \end{aligned}$ |

${ }^{1}$ All voltages are relative to their respective ground.
${ }^{2} V_{D D I}$ and $V_{D D O}$ refer to the supply voltages on the input and output sides of a given channel, respectively. See the PC Board Layout section.
${ }^{3}$ See Figure 4 for maximum rated current values for various temperatures.
${ }^{4}$ Refers to common-mode transients across the insulation barrier. Commonmode transients exceeding the Absolute Maximum Ratings can cause latchup or permanent damage.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Table 10. Maximum Continuous Working Voltage ${ }^{1}$

## APPLICATION INFORMATION

## PC BOARD LAYOUT

The ADuM3400/ADuM3401/ADuM3402 digital isolators require no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see Figure 17). Bypass capacitors are most conveniently connected between Pin 1 and Pin 2 for $V_{D D 1}$ and between Pin 15 and Pin 16 for $V_{\text {DD2 }}$. The capacitor value must be between $0.01 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$. The total lead length between both ends of the capacitor and the input power supply pin must not exceed 20 mm . Bypassing between Pin 1 and Pin 8 and between Pin 9 and Pin 16 must also be considered unless the ground pair on each package side is connected close to the package.

Figure 17. Recommended Printed Circuit Board Layout
In applications involving high common-mode transients, care must be taken to ensure that board coupling across the isolation barrier is minimized. Furthermore, the board layout must be designed such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this can cause voltage differentials between pins exceeding the Absolute Maximum Ratings of the device, thereby leading to latch-up or permanent damage.

See the AN-1109 Application Note for board layout guidelines.

## SYSTEM-LEVEL ESD CONSIDERATIONS AND ENHANCEMENTS

System-level ESD reliability (for example, per IEC 61000-4-x) is highly dependent on system design, which varies widely by application. The ADuM3400/ADuM3401/ADuM3402 incorporate many enhancements to make ESD reliability less dependent on system design. The enhancements include:

- ESD protection cells added to all input/output interfaces.
- Key metal trace resistances reduced using wider geometry and paralleling of lines with vias.
- The SCR effect inherent in CMOS devices minimized by use of guarding and isolation technique between PMOS and NMOS devices.
- Areas of high electric field concentration eliminated using $45^{\circ}$ corners on metal traces.
- Supply pin overvoltage prevented with larger ESD clamps between each supply pin and respective ground.

While the ADuM3400/ADuM3401/ADuM3402 improve systemlevel ESD reliability, they are no substitute for a robust systemlevel design. See the AN-793 Application Note, ESD/Latch-Up Considerations with iCoupler Isolation Products for detailed recommendations on board layout and system-level design.

## PROPAGATION DELAY-RELATED PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component. The propagation delay to a logic low output can differ from the propagation delay to a logic high.

Figure 18. Propagation Delay Parameters
Pulse width distortion is the maximum difference between these two propagation delay values and is an indication of how accurately the input signal timing is preserved.
Channel-to-channel matching refers to the maximum amount the propagation delay differs between channels within a single ADuM3400/ADuM3401/ADuM3402 component.
Propagation delay skew refers to the maximum amount the propagation delay differs between multiple ADuM3400/ADuM3401/ ADuM3402 components operating under the same conditions.

## DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

Positive and negative logic transitions at the isolator input cause narrow ( $\sim 1 \mathrm{~ns}$ ) pulses to be sent to the decoder via the transformer. The decoder is bistable and is, therefore, either set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than $\sim 1 \mu \mathrm{~s}$, a periodic set of refresh pulses indicative of the correct input state are sent to ensure dc correctness at the output. If the decoder receives no internal pulses of more than about $5 \mu$ s, the input side is assumed to be unpowered or nonfunctional, in which case the isolator output is forced to a default state (see Table 11) by the watchdog timer circuit.
The limitation on the magnetic field immunity of the ADuM3400/ ADuM3401/ADuM3402 is set by the condition in which induced voltage in the receiving coil of the transformer is sufficiently large to either falsely set or reset the decoder. The following analysis defines the conditions under which this can occur. The 3.3 V operating condition of the ADuM3400/ADuM3401/ADuM3402 is examined because it represents the most susceptible mode of operation.

The pulses at the transformer output have an amplitude greater than 1.0 V . The decoder has a sensing threshold at about 0.5 V , thus establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$
V=(-d \beta / d t) \sum \Pi r_{n}^{2} ; N=1,2, \ldots, N
$$

where:
$\beta$ is magnetic flux density (gauss).
$N$ is the number of turns in the receiving coil.
$r_{n}$ is the radius of the $\mathrm{n}^{\text {th }}$ turn in the receiving coil ( cm ).
Given the geometry of the receiving coil in the ADuM3400/ ADuM3401/ADuM3402 and an imposed requirement that the induced voltage be at most $50 \%$ of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated as shown in Figure 19.

Figure 19. Maximum Allowable External Magnetic Flux Density
For example, at a magnetic field frequency of 1 MHz , the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil, which is about $50 \%$ of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse (and is of the worst-case polarity), it reduces the received pulse from $>1.0 \mathrm{~V}$ to 0.75 V -still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances from the ADuM3400/ ADuM3401/ADuM3402 transformers. Figure 20 expresses these allowable current magnitudes as a function of frequency for selected distances. As shown, the ADuM3400/ADuM3401/ ADuM3402 are extremely immune and can be affected only by extremely large currents operated at high frequency very close to the component. For the 1 MHz example noted, place a 0.5 kA current 5 mm away from the ADuM3400/ADuM3401/ADuM3402 to affect the operation of the component.

Figure 20. Maximum Allowable Current for Various Current-toADuM3400/ADuM3401/ADuM3402 Spacings

Note that at combinations of strong magnetic field and high frequency, any loops formed by printed circuit board traces can induce error voltages sufficiently large enough to trigger the thresholds of succeeding circuitry. Care must be taken in the layout of such traces to avoid this possibility.

## POWER CONSUMPTION

The supply current at a given channel of the ADuM3400/ ADuM3401/ADuM3402 isolator is a function of the supply voltage, the channel data rate, and the channel output load.
For each input channel, the supply current is given by

$$
\begin{array}{ll}
I_{D D I}=I_{D D I}(Q) & f \leq 0.5 f_{r} \\
I_{D D I}=I_{D D I}(D) \times\left(2 f-f_{r}\right)+I_{D D I(Q)} & f>0.5 f_{r}
\end{array}
$$

For each output channel, the supply current is given by

$$
\begin{aligned}
& I_{D D O}=I_{D D O(Q)} f \leq 0.5 f_{r} \\
& I_{D D O}=\left(I_{D D O(D)}+\left(0.5 \times 10^{-3}\right) \times C_{L} \times V_{D D O}\right) \times\left(2 f-f_{r}\right)+I_{D D O(Q)} \\
& f>0.5 f_{r}
\end{aligned}
$$

where:
$I_{D D I(D)}, I_{D D O(D)}$ are the input and output dynamic supply currents per channel (mA/Mbps).
$C_{L}$ is the output load capacitance ( pF ).
$V_{D D O}$ is the output supply voltage ( V ).
$f$ is the input logic signal frequency ( MHz ); it is half of the input data rate expressed in units of Mbps. $f_{r}$ is the input stage refresh rate (Mbps).
$I_{D D I(Q)}, I_{D D O(Q)}$ are the specified input and output quiescent supply currents (mA).

## ADuM3400/ADuM3401/ADuM3402

To calculate the total $\mathrm{I}_{\mathrm{DD} 1}$ and $\mathrm{I}_{\mathrm{DD} 2}$ supply current, the supply currents for each input and output channel corresponding to $V_{D D 1}$ and $V_{D D 2}$ are calculated and totaled. Figure 8 provides the per-channel input supply current as a function of the data rate. Figure 9 and Figure 10 provide the per-channel supply output current as a function of the data rate for an unloaded output condition and for a 15 pF output condition, respectively. Figure 11 through Figure 15 provide the total $V_{D D 1}$ and $V_{D D 2}$ supply current as a function of the data rate for the ADuM3400/ADuM3401/ ADuM3402 channel configurations.

## INSULATION LIFETIME

All insulation structures eventually break down when subjected to voltage stress over a sufficiently long period. The rate of insulation degradation is dependent on the characteristics of the voltage waveform applied across the insulation. In addition to the testing performed by the regulatory agencies, Analog Devices carries out an extensive set of evaluations to determine the lifetime of the insulation structure within the ADuM3400/ ADuM3401/ADuM3402.

Analog Devices performs accelerated life testing using voltage levels higher than the rated continuous working voltage. Acceleration factors for several operating conditions are determined. These factors allow calculation of the time to failure at the actual working voltage. The values shown in Figure 21 summarize the peak voltage for 50 years of service life for a bipolar ac operating condition, and the maximum CSA/VDE approved working voltages. In many cases, the approved working voltage is higher than the 50 -year service life voltage. Operation at these high working voltages can lead to shortened insulation life in some cases.

The insulation lifetime of the ADuM3400/ADuM3401/ ADuM3402 depends on the voltage waveform type imposed across the isolation barrier. The $i$ Coupler insulation structure degrades at different rates depending on whether the waveform is bipolar ac, unipolar ac, or dc. Figure 21, Figure 22, and Figure 23 illustrate these different isolation voltage waveforms.

Bipolar ac voltage is the most stringent environment. The goal of a 50 -year operating lifetime under the ac bipolar condition determines the recommended maximum working voltage of Analog Devices.

In the case of unipolar ac or dc voltage, the stress on the insulation is significantly lower, which allows operation at higher working voltages while still achieving a 50 -year service life. The working voltages listed in Table 10 can be applied while maintaining the 50 -year minimum lifetime provided the voltage conforms to either the unipolar ac or dc voltage cases. Any cross insulation voltage waveform that does not conform to Figure 22 or Figure 23 must be treated as a bipolar ac waveform and the peak voltage must be limited to the 50 -year lifetime voltage value listed in Table 10.

Note that the voltage presented in Figure 22 is shown as sinusoidal for illustration purposes only. It is meant to represent any voltage waveform varying between 0 V and some limiting value. The limiting value can be positive or negative, but the voltage cannot cross 0 V .

## OUTLINE DIMENSIONS

COMPLIANT TO JEDEC STANDARDS MS-013-AA CONTROLLING DIMENSIONS ARE IN MILLIMETERS; INCH DIMENSIONS (IN PARENTHESES) ARE ROUNDED-OFF MILLIMETER EQUIVALENTS FOR REFERENCE ONLY AND ARE NOT APPROPRIATE FOR USE IN DESIGN.

Figure 24. 16-Lead Standard Small Outline Package [SOIC_W] Wide Body (RW-16)
Dimensions shown in millimeters and (inches)

## ORDERING GUIDE

| Model ${ }^{1,2}$ | Number of Inputs, $V_{\text {DD } 1}$ Side | Number of Inputs, $V_{\mathrm{DD} 2}$ Side | Maximum Data Rate (Mbps) | Maximum Propagation Delay, 5 V (ns) | Maximum Pulse Width Distortion (ns) | Temperature Range | Package Description | Package Option |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADuM3400ARWZ | 4 | 0 | 1 | 100 | 40 | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 16-Lead SOIC_W | RW-16 |
| ADuM3400BRWZ | 4 | 0 | 10 | 50 | 3 | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 16-Lead SOIC_W | RW-16 |
| ADuM3400CRWZ | 4 | 0 | 90 | 32 | 2 | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 16-Lead SOIC_W | RW-16 |
| ADuM3401ARWZ | 3 | 1 | 1 | 100 | 40 | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 16-Lead SOIC_W | RW-16 |
| ADuM3401BRWZ | 3 | 1 | 10 | 50 | 3 | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 16-Lead SOIC_W | RW-16 |
| ADuM3401CRWZ | 3 | 1 | 90 | 32 | 2 | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 16-Lead SOIC_W | RW-16 |
| ADuM3402ARWZ | 2 | 2 | 1 | 100 | 40 | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 16-Lead SOIC_W | RW-16 |
| ADuM3402BRWZ | 2 | 2 | 10 | 50 | 3 | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 16-Lead SOIC_W | RW-16 |
| ADuM3402CRWZ | 2 | 2 | 90 | 32 | 2 | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 16-Lead SOIC_W | RW-16 |

[^0]:    ${ }^{1} V_{I x}$ and $V_{O x}$ refer to the input and output signals of a given channel ( $A, B, C$, or $D$ ). $V_{E x}$ refers to the output enable signal on the same side as the $V_{O x}$ outputs. $V_{D D I}$ and $V_{D D O}$ refer to the supply voltages on the input and output sides of the given channel, respectively.
    ${ }^{2}$ In noisy environments, connecting $\mathrm{V}_{\mathrm{Ex}}$ to an external logic high or low is recommended.

[^1]:    ${ }^{1}$ Z = RoHS Compliant Part.
    ${ }^{2}$ Tape and reel are available. The addition of an -RL suffix designates a $13^{\prime \prime}$ ( 1,000 units) tape-and-reel option.
