

LTC4425EDD: Linear Supercap Charger With Current-Limited Ideal Diode And V/I Monitor

DESCRIPTION

Demonstration Circuit DC1589A is a Linear Supercap Charger with Current-Limited Ideal Diode and V/I Monitor, featuring the LTC[®]4425.

PERFORMANCE SUMMARY Specifications are at T_a = 25°C

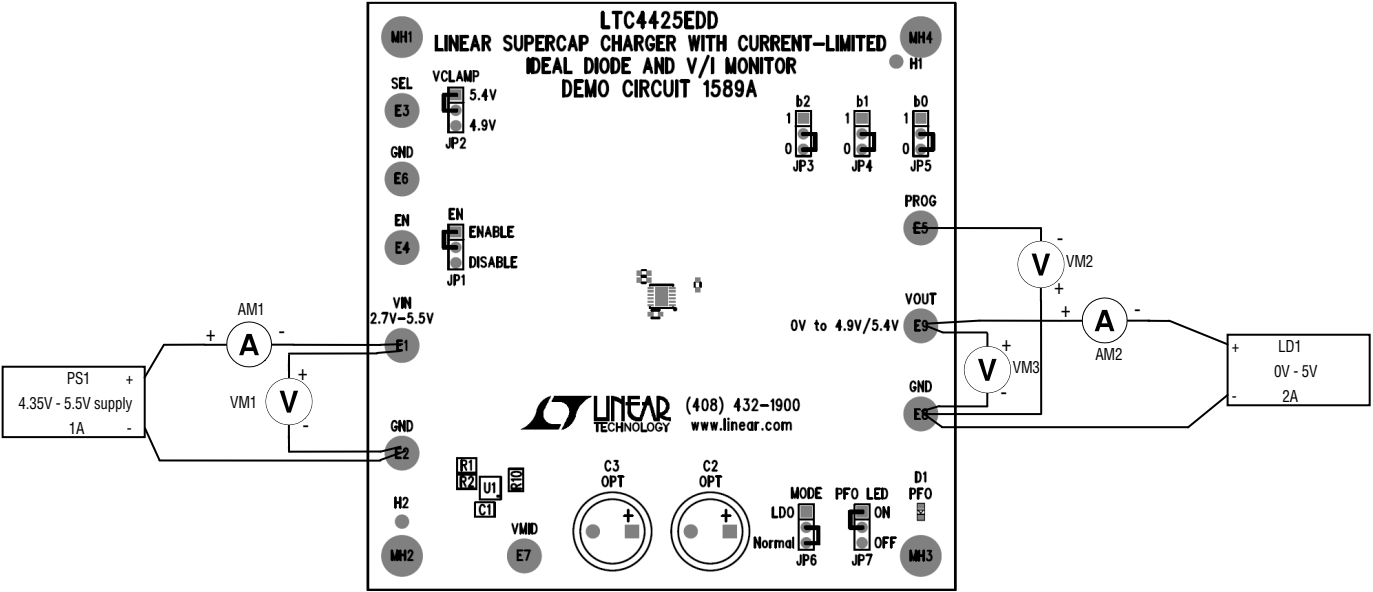

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V _{in}	Input Voltage Range		2.7		5.5	V
I _{charge}	Supercap Charge current				2	A
V _{OUT}	Supercap Stack Output Voltage		1.2		5.4	V
V(MID)	Supercap Midpoint Voltage		0.6		2.7	V

QUICK START PROCEDURE

Refer to Figure 1 for the proper measurement equipment setup and jumper settings and follow the procedure below.

NOTE. When measuring the input or output voltage ripple, care must be taken to avoid a long ground lead on the oscilloscope probe. Measure the input or output voltage ripple by touching the probe tip directly across the V_{BUS} or V_{OUT}(x) and GND terminals. See Figure 2 for proper scope probe technique.

1. Set b[2-0] jumpers (JP3, JP4, JP5) to “1”. Set MODE (JP6) to “LDO”. Set LD1 to 0A, and PS1 to 5V. Observe V_{OUT} (VM3) = 3.3V, I(VIN) (AM1) = 2A, and V(PROG) (VM2) = 1V. Note: The supercapacitor COUT1 will charge in approximately 0.5 seconds, so please observe these signals within a few seconds of setting PS1 to 5V.
2. Set PS1 to 0V. Observe D1 (PFO) should be lit due to input ‘power failure’
3. Set LD1 to 1A. Observe V_{OUT}. V_{OUT} should decrease to 0V, in about 1 second.

Note: All connections from equipment should be Kelvin connected directly to the board pins which they are connected on this diagram and any input or output leads should be twisted pair.
