

DESCRIPTION

Demonstration circuit 506A is a two-phase, step down charge pump DC/DC converter featuring the LTC3251EMSE. It produces regulated 1.5V output voltage at up to 500mA of output current from 3.2V to 5.5V input. A unique two phase, spread spectrum architecture of the LTC3251 provides highly efficient and low noise operation. The burst and super-burst operating modes also reduce operating current at light load conditions. The circuit has

a low external parts count and requires only four small surface mount capacitors. DC 506 demonstrates appropriate layout techniques for the LTC3251 Inductorless DC-DC converter. This power supply circuit is ideally suited for space-constrained battery-powered applications that require small size and low operating current.

Design files for this circuit board are available. Call the LTC factory.

QUICK START PROCEDURE

Demonstration circuit DC506 is easy to set up to evaluate the performance of the LTC3251. Refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

NOTE:When measuring the input or output voltage ripple, care must be taken to avoid a long ground lead on the oscilloscope probe. Measure the input or output voltage ripple by touching the probe tip directly across the VIN or VOUT and GND terminals. See Figure 2 for proper scope probe technique.

1. With power off, connect input power source to VIN and GND terminals. Input voltage range is limited to between 3.2V and 5.5V.
2. Place operation mode selector jumper JP1 in the GND position, JP2 in the VIN position for Burst Mode operation.
3. Connect load between the VOUT and GND terminals.
4. Turn on the power at the input.

NOTE:Make sure that the input voltage does not exceed 5.5V.

5. Check for the proper output voltages. VOUT = 1.5V.

If there is no output, temporarily disconnect the load to make sure that the load is not set too high.

6. Once the proper output voltages are established, adjust the loads up to 500mA and observe the output voltage regulation, input and output ripple voltage, efficiency and other parameters.

NOTE: IOUT derates linearly to 200mA for VIN less than 3.5V.

7. For continuous mode operation, set operation mode selector jumper JP1 in the VIN position, JP2 in the GND position. Please refer Table 1 for other modes of operation.

Table 1. Modes of Operation:

JP1	JP2	MODE
GND	GND	SHUTDOWN
GND	VIN	BURST
VIN	GND	CONTINUOUS
VIN	VIN	SUPER BURST
