## Data Sheet

## FEATURES

16-bit resolution
14-bit resolution
2- or 4-quadrant multiplying DAC
$\pm 1$ LSB DNL
$\pm 1$ LSB INL
Operating supply voltage: 2.7 V to 5.5 V
Low noise: $12 \mathrm{nV} / \sqrt{\mathrm{Hz}}$
Low power: $I_{D D}=10 \mu \mathrm{~A}$
$0.5 \mu \mathrm{~s}$ settling time
Built-in $\mathrm{R}_{\mathrm{FB}}$ facilitates current-to-voltage conversion
Built-in 4-quadrant resistors allow $\mathbf{0} \mathrm{V}$ to $-10 \mathrm{~V}, \mathbf{0} \mathrm{~V}$ to +10 V , or $\pm 10 \mathrm{~V}$ outputs
2 mA full-scale current $\pm \mathbf{2 0 \%}$, with $\mathrm{V}_{\text {REF }}=10 \mathrm{~V}$
Automotive operating temperature: $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
Compact TSSOP-28 package

## APPLICATIONS

Automatic test equipment Instrumentation
Digitally controlled calibration
Digital waveform generation

## FUNCTIONAL BLOCK DIAGRAM

Figure 1. AD5546/AD5556 Simplified Block Diagram

## GENERAL DESCRIPTION

The AD5546/AD5556 are precision 16-/14-bit, multiplying, low power, current output, parallel input digital-to-analog converters (DACs). They operate from a single 2.7 V to 5.5 V supply with $\pm 10 \mathrm{~V}$ multiplying references for four-quadrant outputs. Builtin four-quadrant resistors facilitate the resistance matching and temperature tracking that minimize the number of components needed for multiquadrant applications. The feedback resistor ( $\mathrm{R}_{\mathrm{FB}}$ ) simplifies the I-V conversion with an external buffer. The AD5546/AD5556 are packaged in compact TSSOP-28 packages with operating temperatures from $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.
The EVAL-AD5546SDZ is available for evaluating DAC performance. For more information, see the UG-309 evaluation board user guide.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

| Parameter | Rating |
| :---: | :---: |
| $V_{\text {DD }}$ to GND | -0.3 V, +8V |
| R ${ }_{\text {fb, }}$ Rofs, R1, Rcom, and REF to GND | $-18 \mathrm{~V}, 18 \mathrm{~V}$ |
| Logic Inputs to GND | $-0.3 \mathrm{~V},+8 \mathrm{~V}$ |
| V (lout) to GND | $-0.3 \mathrm{~V}, \mathrm{~V} D+0.3 \mathrm{~V}$ |
| Input Current to Any Pin Except Supplies | $\pm 50 \mathrm{~mA}$ |
| Thermal Resistance ( $\theta_{\mathrm{JA}}$ ) | $128^{\circ} \mathrm{C}$ |
| Maximum Junction Temperature ( $\mathrm{T}_{\mathrm{max}}$ ) | $150^{\circ} \mathrm{C}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Lead Temperature: |  |
| Vapor Phase, 60 s | $215^{\circ} \mathrm{C}$ |
| Infrared, 15 s | $220^{\circ} \mathrm{C}$ |
| Package Power Dissipation | $\left(\mathrm{T}_{\text {Jmax }}-\mathrm{T}_{\mathrm{A}}\right) / \theta_{\text {JA }}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

|  | ESD (electrostatic discharge) sensitive device. <br> Charged devices and circuit boards can discharge <br> without detection. Although this product features <br> patented or proprietary protection circuitry, damage <br> may occur on devices subjected to high energy ESD. <br> Therefore, proper ESD precautions should be taken to <br> avoid performance degradation or loss of functionality. |

## PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Figure 4. AD5546 Pin Configuration

Figure 5. AD5556 Pin Configuration

Table 3. AD5546 Pin Function Descriptions

| Pin No. | Mnemonic | Description |
| :---: | :---: | :---: |
| 1 to 8 | D7 to D0 | Digital Input Data Bits[D7: D0]. The signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 9 | Rofs | Bipolar Offset Resistor. Accepts up to $\pm 18 \mathrm{~V}$. In two-quadrant mode, ties to RfB. In four-quadrant mode, ties to R1 and the external reference. |
| 10 | $\mathrm{R}_{\text {fb }}$ | Internal Matching Feedback Resistor. Connects to the output of an external op amp for I-V conversion. |
| 11 | R1 | Four-Quadrant Resistor R1. In two-quadrant mode, shorts to the REF pin. In four-quadrant mode, ties to Rofs. |
| 12 | Rcom | Center Tap Point of Two Four-Quadrant Resistors, R1 and R2. In four-quadrant mode, ties to the inverting node of the reference amplifier. In two-quadrant mode, shorts to the REF pin. |
| 13 | REF | DAC Reference Input in Two-Quadrant Mode and R2 Terminal in Four-Quadrant Mode. In two-quadrant mode, this pin is the reference input with constant input resistance vs. code. In four-quadrant mode, this pin is driven by the external reference amplifier. |
| 14 | lout | DAC Current Output. Connects to the inverting node of an external op amp for I-V conversion. |
| 15 | LDAC | Digital Input Load DAC Control. Signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 16 | $\overline{\mathrm{WR}}$ | Write Control Digital Input in Active Low. Transfers shift-register data to the DAC register on the rising edge. The signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 17 | MSB | Power-On Reset State. $\mathrm{MSB}=0$ resets at zero scale; MSB $=1$ resets at midscale. The signal level must be $\leq V_{D D}+0.3 \mathrm{~V}$. |
| 18 | $\overline{\mathrm{RS}}$ | Reset in Active Low. Resets to zero scale if $M S B=0$, and resets to midscale if $M S B=1$. The signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 19 | GND | Analog and Digital Grounds. |
| 20 to 21 | D15 to D14 | Digital Input Data Bits[D15:D14]. The signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 22 to 27 | D13 to D8 | Digital Input Data Bits[D13:D8]. The signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 28 | VDD | Positive Power Supply Input. Specified range of operation: 2.7 V to 5.5 V . |

Table 4. AD5556 Pin Function Descriptions

| Pin No. | Mnemonic | Description |
| :--- | :--- | :--- |
| 1 to 6 | D5 to D0 | Digital Input Data Bits[D5:D0]. The signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 7 to 8 | NC | No Connection. The user should not connect anything other than dummy pads on these terminals. |
| 9 | Rofs | Bipolar Offset Resistor. Accepts up to $\pm 18 \mathrm{~V}$. In two-quadrant mode, ties to RFB. In four-quadrant mode, ties to R1 <br> and the external reference. |
| 10 | R $_{\text {FB }}$ | Internal Matching Feedback Resistor. Connects to the output of an external op amp for I-V conversion. <br> 11 |
| R1 | Four-Quadrant Resistor R1. In two-quadrant mode, shorts to the REF pin. In four-quadrant mode, ties to Rofs. |  |
| 12 | Rcom | Center Tap Point of Two Four-Quadrant Resistors, R1 and R2. In four-quadrant mode, ties to the inverting node of <br> the reference amplifier. In two-quadrant mode, shorts to the REF pin. |

## AD5546/AD5556

| Pin No. | Mnemonic | Description |
| :---: | :---: | :---: |
| 13 | REF | DAC Reference Input in Two-Quadrant Mode and R2 Terminal in Four-Quadrant Mode. In two-quadrant mode, this pin is the reference input with constant input resistance vs. code. In four-quadrant mode, this pin is driven by the external reference amplifier. |
| 14 | lout | DAC Current Output. Connects to the inverting node of an external op amp for I-V conversion. |
| 15 | LDAC | Digital Input Load DAC Control. The signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 16 | $\overline{W R}$ | Write Control Digital Input in Active Low. Transfers shift-register data to the DAC register on the rising edge. The signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 17 | MSB | Power On Reset State. MSB $=0$ resets at zero scale; MSB $=1$ resets at midscale. The signal level must be $\leq V_{D D}+0.3 \mathrm{~V}$. |
| 18 | $\overline{\mathrm{RS}}$ | Reset in Active Low. Resets to zero scale if $M S B=0$ and resets to midscale if $M S B=1$. The signal level must be $\leq V_{D D}+0.3 \mathrm{~V}$. |
| 19 | GND | Analog and Digital Grounds. |
| 20 to 27 | D13 to D6 | Digital Input Data Bits[D13:D6]. The signal level must be $\leq \mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. |
| 28 | VDD | Positive Power Supply Input. Specified range of operation: 2.7 V to 5.5 V . |

## CIRCUIT OPERATION

## DIGITAL-TO-ANALOG (DAC) CONVERTER SECTION

The AD5546/AD5556 are 16-/14-bit multiplying, current output, and parallel input DACs. The devices operate from a single 2.7 V to 5.5 V supply and provide both unipolar 0 V to $-\mathrm{V}_{\text {REF }}$, or 0 V to $+\mathrm{V}_{\text {REF }}$, and bipolar $\pm \mathrm{V}_{\text {REF }}$ output ranges from a -18 V to +18 V reference. In addition to the precision conversion $\mathrm{R}_{\mathrm{FB}}$ commonly found in current output DACs, there are three additional precision resistors for four-quadrant bipolar applications.
The AD5546/AD5556 consist of two groups of precision R-2R ladders, which make up the $12 / 10$ LSBs, respectively. Furthermore, the four MSBs are decoded into 15 segments of resistor value 2R. Figure 17 shows the architecture of the 16-bit AD5546. Each of the 16 segments in the R-2R ladder carries an equally weighted current of one-sixteenth of full scale. The feedback resistor, $\mathrm{R}_{\mathrm{FB}}$, and four-quadrant resistor, $\mathrm{R}_{\mathrm{FFS}}$, have values of 10 $\mathrm{k} \Omega$. Each four-quadrant resistor, R1 and R2, equals $5 \mathrm{k} \Omega$. In four-quadrant operation, R1, R2, and an external op amp work together to invert the reference voltage and apply it to the REF input. With Rofs and $\mathrm{R}_{\mathrm{FB}}$ connected as shown in Figure 2, the output can swing from $-V_{\text {ref }}$ to $+V_{\text {ref. }}$
The reference voltage inputs exhibit a constant input resistance of $5 \mathrm{k} \Omega \pm 20 \%$. The DAC output, Iout, impedance is code dependent. External amplifier choice should take into account the
variation of the AD5546/AD5556 output impedance. The feedback resistance in parallel with the DAC ladder resistance dominates output voltage noise. To maintain good analog performance, it is recommended to bypass the power supply with a $0.01 \mu \mathrm{~F}$ to $0.1 \mu \mathrm{~F}$ ceramic or chip capacitor in parallel with a $1 \mu \mathrm{~F}$ tantalum capacitor. Also, to minimize gain error, PCB metal traces between $V_{\text {REF }}$ and $\mathrm{R}_{\mathrm{FB}}$ should match.

Every code change of the DAC corresponds to a step function; gain peaking at each output step may occur if the op amp has limited GBP and excessive parasitic capacitance present at the op amp inverting node. A compensation capacitor, therefore, may be needed between the I-V op amp inverting and output nodes to smooth the step transition. Such a compensation capacitor should be found empirically, but a 20 pF capacitor is generally adequate for the compensation.
The $V_{D D}$ power is used primarily by the internal logic and to drive the DAC switches. Note that the output precision degrades if the operating voltage falls below the specified voltage. The user should also avoid using switching regulators because device power supply rejection degrades at higher frequencies.

Figure 17. 16-Bit AD5546 Equivalent R-2R DAC Circuit with Digital Section

## DIGITAL SECTION

The AD5546/AD5556 have 16-/14-bit parallel inputs. The devices are double buffered with 16-/14-bit registers. The double-buffered feature allows the update of several AD5546/AD5556 simultaneously. For the AD5546, the input register is loaded directly from a 16-bit controller bus when the $\overline{\mathrm{WR}}$ pin is brought low. The DAC register is updated with data from the input register when LDAC is brought high. Updating the DAC register updates the DAC output with the new data (see Figure 17). To make both registers transparent, tie $\overline{\mathrm{WR}}$ low and LDAC high. The asynchronous $\overline{\mathrm{RS}}$ pin resets the part to zero scale if the MSB pin $=0$ and to midscale if the MSB pin $=1$.

${ }^{1} \mathrm{X}=$ don't care.

## ESD PROTECTION CIRCUITS

All logic input pins contain back-biased ESD protection Zeners connected to ground (GND) and $V_{\text {DD }}$, as shown in Figure 18. As a result, the voltage level of the logic input should not be greater than the supply voltage.

Figure 18. Equivalent ESD Protection Circuits

## AMPLIFIER SELECTION

In addition to offset voltage, the bias current is important in op amp selection for precision current output DACs. An input bias current of 30 nA in the op amp contributes to 1 LSB in the AD5546's full-scale error. The OP1177 and AD8628 op amps
are good candidates for the I-V conversion.

## REFERENCE SELECTION

The initial accuracy and the rated output of the voltage reference determine the full span adjustment. The initial accuracy is usually a secondary concern in precision because it can be trimmed. Figure 23 shows an example of a trimming circuit. The zero scale error can also be minimized by standard op amp nulling techniques.
The voltage reference temperature coefficient (TC) and longterm drift are primary considerations. For example, a 5 V reference with a TC of $5 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ means that the output changes by $25 \mu \mathrm{~V}$ per degree Celsius. As a result, the reference that operates at $55^{\circ} \mathrm{C}$ contributes an additional $750 \mu \mathrm{~V}$ full-scale error.

Similarly, the same 5 V reference with a $\pm 50 \mathrm{ppm}$ long-term drift means that the output may change by $\pm 250 \mu \mathrm{~V}$ over time. Therefore, it is practical to calibrate a system periodically to maintain its optimum precision.

## APPLICATIONS INFORMATION

## UNIPOLAR MODE

Two-Quadrant Multiplying Mode, $\boldsymbol{V}_{\text {out }}=\mathbf{0}$ V to $-\boldsymbol{V}_{\text {REF }}$
The AD5546/AD5556 DAC architecture uses a current-steering $\mathrm{R}-2 \mathrm{R}$ ladder design that requires an external reference and op amp to convert the unipolar mode of output voltage to

AD5546

$$
\begin{equation*}
V_{\text {OUT }}=-V_{\text {REF }} \times D / 65,536 \tag{1}
\end{equation*}
$$

AD5556

$$
\begin{equation*}
V_{\text {OUT }}=-V_{\text {REF }} \times D / 16,384 \tag{2}
\end{equation*}
$$

where $D$ is the decimal equivalent of the input code.
The output voltage polarity is opposite to the $V_{\text {ref }}$ polarity in this case (see Figure 19). Table 8 shows the negative output vs. code for the AD5546.

Table 8. AD5546 Unipolar Mode Negative Output vs. Code

| D in Binary | $\mathbf{V}_{\text {OUt }}(\mathbf{V})$ |
| :--- | :--- |
| 1111111111111111 | $-\mathrm{V}_{\text {Ref }}(65,535 / 65,536)$ |
| 1000000000000000 | $-V_{\text {REF }} / 2$ |
| 0000000000000001 | $-\mathrm{V}_{\text {REF }}(1 / 65,536)$ |
| 0000000000000000 | 0 |

## Two-Quadrant Multiplying Mode, $V_{\text {out }}=0$ V to $+V_{\text {REF }}$

The AD5546/AD5556 are designed to operate with either positive or negative reference voltages. As a result, positive output can be achieved with an additional op amp, (see Figure 20), and the output becomes
AD5546

$$
\begin{equation*}
V_{\text {OUT }}=+V_{\text {REF }} \times D / 65,536 \tag{3}
\end{equation*}
$$

AD5556

$$
\begin{equation*}
V_{\text {OUT }}=+V_{R E F} \times D / 16,384 \tag{4}
\end{equation*}
$$

Table 9 shows the positive output vs. code for the AD5546.
Table 9. AD5546 Unipolar Mode Positive Output vs. Code

| D in Binary | V $_{\text {out }}(\mathbf{V})$ |

Figure 21. Four-Quadrant Multiplying Mode, $V_{\text {OUT }}=-V_{\text {REF }}$ to $+V_{\text {REF }}$

## BIPOLAR MODE

## Four-Quadrant Multiplying Mode, $\boldsymbol{V}_{\text {out }}=-\boldsymbol{V}_{\text {REF }}$ to $+V_{\text {REF }}$

The AD5546/AD5556 contain on-chip all the four-quadrant resistors necessary for the precision bipolar multiplying operation. Such a feature minimizes the number of exponent components to only a voltage reference, dual op amp, and compensation capacitor (see Figure 21). For example, with a

10 V reference, the circuit yields a precision, bipolar -10 V to +10 V output.

$$
\begin{align*}
& \text { AD5546 } \\
& \qquad V_{\text {OUT }}=(D / 32768-1) \times V_{R E F} \tag{5}
\end{align*}
$$

AD5556

$$
\begin{equation*}
V_{\text {OUT }}=(D / 16384-1) \times V_{\text {REF }} \tag{6}
\end{equation*}
$$

Table 10 shows some of the results for the 16-bit AD5546.

Table 10. AD5546 Output vs. Code

## AC REFERENCE SIGNAL ATTENUATOR

Besides handling digital waveforms decoded from parallel input data, the AD5546/AD5556 handle equally well low frequency
ac reference signals for signal attenuation, channel equalization, and waveform generation applications. The maximum signal range can be up to $\pm 18 \mathrm{~V}$ (see Figure 22).

## SYSTEM CALIBRATION

The initial accuracy of the system can be adjusted by trimming the voltage reference ADR0x with a digital potentiometer (see Figure 23). The AD5170 provides an OTP (one time programmable), 8 -bit adjustment that is ideal and reliable for such calibration. The Analog Devices, Inc., OTP digital potentiometer comes with programmable software that simplifies the factory calibration process.

## REFERENCE SELECTION

When selecting a reference for use with the AD55xx series of current output DACs, pay attention to the output voltage temperature coefficient specification of the reference. Choosing a precision reference with a low output temperature coefficient minimizes error sources. Table 11 lists some of the references available from Analog Devices that are suitable for use with this range of current output DACs.

## AMPLIFIER SELECTION

The primary requirement for the current-steering mode is an amplifier with low input bias currents and low input offset voltage. Because of the code-dependent output resistance of the DAC, the input offset voltage of an op amp is multiplied by the variable gain of the circuit. A change in this noise gain between two adjacent digital fractions produces a step change in the output voltage due to the amplifier's input offset voltage. This output voltage change is superimposed on the desired change in output between the two codes and gives rise to a differential linearity error, which, if large enough, can cause the DAC to be nonmonotonic.

The input bias current of an op amp also generates an offset at the voltage output because of the bias current flowing in the feedback resistor, $\mathrm{R}_{\mathrm{FB}}$.

Common-mode rejection of the op amp is important in voltageswitching circuits because it produces a code-dependent error at the voltage output of the circuit.

Provided that the DAC switches are driven from true wideband low impedance sources, they settle quickly. Consequently, the slew rate and settling time of a voltage-switching DAC circuit is determined largely by the output op amp. To obtain minimum settling time in this configuration, minimize capacitance at the $\mathrm{V}_{\text {REF }}$ node (the voltage output node in this application) of the DAC. This is done by using low input capacitance buffer amplifiers and careful board design.

Analog Devices offers a wide range of amplifiers for both precision dc and ac applications, as listed in Table 12 and Table 13.
