## FEATURES

Half-duplex, isolated RS-485 transceiver PROFIBUS ${ }^{\ominus}$ compliant
ANSI EIA/TIA 485-A and ISO 8482: 1987(E) compliant
20 Mbps data rate
5 V or 3 V operation ( $V_{\text {DD1 }}$ )
High common-mode transient immunity: > $\mathbf{2 5} \mathbf{~ k V / \mu s}$
Isolated DE status output
Receiver open-circuit, fail-safe design
Thermal shutdown protection
50 nodes on bus
Safety and regulatory approvals
UL recognition- $\mathbf{2 5 0 0}$ V $_{\text {rms }}$ for 1 minute per UL 1577
CSA Component Acceptance Notice \#5A
IEC 609501800 V $_{\text {rms }}$ (basic), 400 V $_{\text {rms }}$ (reinforced)
VDE Certificate of Conformity DIN V VDE 0884-10 (VDE V 0884-10): 2006-12

## $V_{\text {IORм }}=560$ V peak

Operating temperature range: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
Wide body, 16-lead SOIC package

## APPLICATIONS

Isolated RS-485/RS-422 interfaces
PROFIBUS networks
Industrial field networks
Multipoint data transmission systems

## GENERAL DESCRIPTION

The ADM2486 differential bus transceiver is an integrated, galvanically isolated component designed for bidirectional data communication on multipoint bus transmission lines. It is designed for balanced transmission lines and complies with ANSI EIA/TIA-485-A and ISO 8482: 1987(E).

The device employs Analog Devices $i$ Coupler ${ }^{\circledR}$ technology to combine a 3-channel isolator, a three-state differential line driver, and a differential input receiver into a single package. The logic side of the device is powered with either a 5 V or a 3 V supply, and the bus side uses an isolated 5 V supply.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.
The ADM2486 driver has an active-high enable feature. The driver differential outputs and the receiver differential inputs are connected internally to form a differential input/output port that imposes minimal loading on the bus when the driver is disabled or when VDD1 or VDD2 $=0 \mathrm{~V}$. Also provided is an active-high receiver disable feature that causes the receive output to enter a high impedance state.

The device has current-limiting and thermal shutdown features to protect against output short circuits and situations where bus contention may cause excessive power dissipation. The part is fully specified over the industrial temperature range and is available in a 16 -lead, wide body SOIC package.

|  |  | 43.0 |  | mA | $2 \mathrm{Mbps}, \mathrm{RTS}=\mathrm{V}_{\mathrm{DD} 1}$, see Figure 5 |
|  |  | 58.0 |  | mA | 20 Mbps , RTS = VDD1, see Figure 5 |

| Parameter | Min Typ Max | Unit | Test Conditions/Comments |  |
| :--- | :--- | :--- | :--- | :--- |
| COMMON-MODE TRANSIENT IMMUNITY ${ }^{1}$ | 25 |  | $\mathrm{kV} / \mu \mathrm{ss}$ | $\mathrm{V}_{\mathrm{cm}}=1 \mathrm{kV}$, <br> transient magnitude $=800 \mathrm{~V}$ |
| HIGH FREQUENCY, COMMON-MODE NOISE IMMUNITY |  | 100 | mV | $\mathrm{V}_{\text {HF }}=+5 \mathrm{~V},-2 \mathrm{~V}<\mathrm{V}_{\text {TEST2 }}<+7 \mathrm{~V}$, <br> $1 \mathrm{MHz}<\mathrm{f}_{\text {TEST }}<50 \mathrm{MHz}$, see Figure 6 |

${ }^{1}$ Common-mode transient immunity is the maximum common-mode voltage slew rate that can be sustained while maintaining specification-compliant operation. $\mathrm{V}_{\text {cm }}$ is the common-mode potential difference between the logic and bus sides. The transient magnitude is the range over which the common-mode is slewed. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

## TIMING SPECIFICATIONS

$2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 5.5 \mathrm{~V}, 4.75 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 5.25 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=\mathrm{T}_{\mathrm{MIN}}$ to $\mathrm{T}_{\mathrm{MAX}}$, unless otherwise noted.

${ }^{2}$ Input capacitance is from any input data pin to ground.

## REGULATORY INFORMATION

The ADM2486 has been approved by the following organizations:
Table 4.

| Organization | Approval Type | Notes |
| :---: | :---: | :---: |
| UL | Recognized under 1577 component recognition program. File E214100. | In accordance with UL1577, each ADM2486 is proof tested by applying an insulation test voltage $\geq 3000 \mathrm{~V}_{\text {rms }}$ for 1 sec (current leakage detection limit $=5 \mu \mathrm{~A}$ ). |
| CSA | Approved under CSA Component Acceptance Notice \#5A. File 205078. IEC 609501800 V $_{\text {rms }}\left(1131\right.$ V Peak ) Basic, $400 \mathrm{~V}_{\text {rms }}\left(565 \mathrm{~V}_{\text {PEAK }}\right)$ reinforced. |  |
| VDE | Certified according to DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12. File 2471900-4880-0001. | In accordance with VDE V 0884-10, each ADM2486 is proof tested by applying an insulation test voltage $\geq 1050 \mathrm{~V}_{\text {PEAK }}$ for 1 sec (partial discharge detection limit $=5 \mathrm{pC}$ ). |

## INSULATION AND SAFETY-RELATED SPECIFICATIONS

Table 5.

| Parameter | Symbol | Value | Unit | Conditions |
| :---: | :---: | :---: | :---: | :---: |
| Rated Dielectric Insulation Voltage |  | 2500 | V rms | 1-minute duration. |
| Minimum External Air Gap (Clearance) | L(101) | 7.45 minimum | mm | Measured from input terminals to output terminals, shortest distance through air. |
| Minimum External Tracking (Creepage) | L(102) | 8.1 minimum | mm | Measured from input terminals to output terminals, shortest distance along body. |
| Minimum Internal Gap (Internal Clearance) |  | 0.017 minimum | mm | Insulation distance through insulation. |
| Tracking Resistance (Comparative Tracking Index) | CTI | >175 | V | DIN IEC 112/VDE 0303 Part 1. |
| Isolation Group |  | Illa |  | Material Group (DIN VDE 0110, 1/89, Table 1). |

## VDE 0884-10 INSULATION CHARACTERISTICS

This isolator is suitable for reinforced electrical isolation only within the safety limit data. Maintenance of the safety data must be ensured by means of protective circuits.

An asterisk (*) on the physical package denotes VDE V 0884-10 approval for 560 V peak working voltage.
Table 6.

## ABSOLUTE MAXIMUM RATINGS

$\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted. All voltages are relative to their respective ground.
Table 7.

| Parameter | Rating |
| :---: | :---: |
| $V_{\text {DD1 }}$ | -0.5 V to +7 V |
| $V_{\text {DD2 }}$ | -0.5 V to +6 V |
| Digital Input Voltage (RTS, $\overline{\mathrm{RE}}, \mathrm{TxD}$ ) | -0.5 V to $\mathrm{V}_{\mathrm{DD} 1}+0.5 \mathrm{~V}$ |
| Digital Output Voltage |  |
| RxD | -0.5 V to $\mathrm{V}_{\mathrm{DD1}}+0.5 \mathrm{~V}$ |
| DE | -0.5 V to $\mathrm{V}_{\mathrm{DD} 2}+0.5 \mathrm{~V}$ |
| Driver Output/Receiver Input Voltage | -9 V to +14 V |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-55^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Average Output Current per Pin | -35 mA to +35 mA |
| $\theta_{\text {JA }}$ Thermal Impedance | $73^{\circ} \mathrm{C} / \mathrm{W}$ |
| Lead Temperature |  |
| Soldering (10 sec) | $260^{\circ} \mathrm{C}$ |
| Vapor Phase (60 sec) | $215^{\circ} \mathrm{C}$ |
| Infrared (15 sec) | $220^{\circ} \mathrm{C}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

|  | ESD (electrostatic discharge) sensitive device. <br> Charged devices and circuit boards can discharge <br> without detection. Although this product features <br> patented or proprietary protection circuitry, damage <br> may occur on devices subjected to high energy ESD. <br> Therefore, proper ESD precautions should be taken to <br> avoid performance degradation or loss of functionality. |
| :--- | :--- |

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

${ }^{1}$ PIN 2 AND PIN 8 ARE INTERNALLY CONNECTED. EITHER OR BOTH MAY BE USED FOR GND. PIN 9 AND PIN 15 ARE INTERNALLY CONNECTED.
EITHER OR BOTH MAY BE USED FOR GND ${ }_{2}$.

Figure 2. Pin Configuration

Table 8. Pin Function Descriptions

| Pin <br> No. | Mnemonic | Description |
| :---: | :---: | :---: |
| 1 | VDD1 | Power Supply (Logic Side), 3 V or 5 V Supply. Decoupling capacitor to $\mathrm{GND}_{1}$ required, capacitor value should be between $0.01 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$. |
| 2,8 | $\mathrm{GND}_{1}$ | Ground (Logic Side). |
| 3 | RxD | Receiver Output Data. This output is high when $(A-B)>200 \mathrm{mV}$ and low when $(A-B)<-200 \mathrm{mV}$. The output is three-stated when the receiver is disabled, that is, when $\overline{\mathrm{RE}}$ is driven high. |
| 4 | $\overline{\mathrm{RE}}$ | Receiver Enable Input. This is an active-low input. Driving this input low enables the receiver, and driving it high disables the receiver. |
| 5 | RTS | Request to Send Input. Driving this input high enables the driver, and driving it low disables the driver. |
| 6 | TxD | Transmit Data Input. Data to be transmitted by the driver is applied to this input. |
| 7 | PV | Power_Valid. Used during power-up and power-down, needs to be tied high when the ADM2486 is operational, see the Applications Information section. |
| 9,15 | $\mathrm{GND}_{2}$ | Ground (Bus Side). |
| 10 | DE | Driver Enable Status Output. This output signals the driver enable or disable status to other devices on the bus. DE is high when the driver is enabled and low when the driver is disabled. |
| 11, 14 | NC | No Connect. |
| 12 | A | Noninverting Driver Output/Receiver Input. When the driver is disabled, or when $V_{D D 1}$ or $V_{D D 2}$ is powered down, Pin A is put into a high impedance state to avoid overloading the bus. |
| 13 | B | Inverting Driver Output/Receiver Input. When the driver is disabled, or when $\mathrm{V}_{\mathrm{DD} 1}$ or $\mathrm{V}_{\mathrm{DD} 2}$ is powered down, Pin $B$ is put into a high impedance state to avoid overloading the bus. |
| 16 | V ${ }_{\text {DD2 }}$ | Power Supply (Bus Side), 5 V Isolated Supply. Decoupling capacitor to GND 2 required, capacitor value should be between $0.01 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$. |

## CIRCUIT DESCRIPTION

## ELECTRICAL ISOLATION

In the ADM2486, electrical isolation is implemented on the logic side of the interface. Therefore, the part has two main sections: a digital isolation section and a transceiver section (see Figure 26). Driver input and request-to-send signals, applied to the TxD and RTS pins, respectively, and referenced to logic ground $\left(\mathrm{GND}_{1}\right)$, are coupled across an isolation barrier to appear at the transceiver section referenced to isolated ground $\left(\mathrm{GND}_{2}\right)$. Similarly, the receiver output, referenced to isolated ground in the transceiver section, is coupled across the isolation barrier to appear at the RxD pin referenced to logic ground.

## iCoupler Technology

The digital signals are transmitted across the isolation barrier using iCoupler technology. This technique uses chip-scale transformer windings to couple the digital signals magnetically from one side of the barrier to the other. Digital inputs are encoded into waveforms that are capable of exciting the primary transformer winding. At the secondary winding, the induced waveforms are then decoded into the binary value that was originally transmitted.

## TRUTH TABLES

The truth tables in this section use these abbreviations:

| Letter | Description |
| :--- | :--- |
| H | High level |
| I | Indeterminate |
| L | Low level |
| X | Irrelevant |
| Z | High impedance (off) |
| NC | Disconnected |

Table 9. Transmitting

| Supply Status |  | Inputs |  |  | Outputs $^{1}$ |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| V $_{\text {DD } 1}$ | V $_{\text {DD } 2}$ | RTS | TxD | A | B | DE |  |
| On | On | H | H | H | L | H |  |
| On | On | H | L | L | H | H |  |
| On | On | L | X | Z | Z | L |  |
| On | Off | X | X | Z | Z | L |  |
| Off | On | X | X | Z | Z | L |  |
| Off | Off | X | X | Z | Z | L |  |

${ }^{1}$ The PV pin is tied high.

Table 10. Receiving

| Supply Status |  | Inputs |  | Output ${ }^{1}$ |
| :---: | :---: | :---: | :---: | :---: |
| VDD1 | VDD2 | A-B (V) | $\overline{\mathrm{RE}}$ | RxD |
| On | On | $>0.2$ | L or NC | H |
| On | On | <-0.2 | L or NC | L |
| On | On | $-0.2<$ A - $<0.2$ | L or NC | I |
| On | On | Inputs open | L or NC | H |
| On | On | X | H | Z |
| On | Off | X | L or NC | H |
| Off | On | X | L or NC | H |
| Off | Off | X | L or NC | L |

${ }^{1}$ The PV pin is tied high.

## POWER-UP/POWER-DOWN THRESHOLDS

The power-up/power-down characteristics of the ADM2486 are in accordance with the supply thresholds shown in Table 11. Upon power-up, the ADM2486 output signals (A, B, RxD, and $\mathrm{DE})$ reach their correct state once both supplies have exceeded their thresholds. Upon power-down, the ADM2486 output signals retain their correct state until at least one of the supplies drops below its power-down threshold. When the $\mathrm{V}_{\text {DDI }}$ powerdown threshold is crossed, the ADM2486 output signals reach their unpowered states within $4 \mu \mathrm{~s}$.

Table 11. Power-Up/Power-Down Thresholds

| Supply | Transition | Threshold (V) |
| :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{DD} 1}$ | Power-up | 2.0 |
| $\mathrm{~V}_{\mathrm{DD} 1}$ | Power-down | 1.0 |
| $\mathrm{~V}_{\mathrm{DD} 2}$ | Power-up | 3.3 |
| $\mathrm{~V}_{\mathrm{DD} 2}$ | Power-down | 2.4 |

## THERMAL SHUTDOWN

The ADM2486 contains thermal shutdown circuitry that protects the part from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. The thermal sensing circuitry detects the increase in die temperature under this condition and disables the driver outputs. This circuitry is designed to disable the driver outputs when a die temperature of $150^{\circ} \mathrm{C}$ is reached. As the device cools, the drivers are re-enabled at a temperature of $140^{\circ} \mathrm{C}$.

## RECEIVER FAIL-SAFE INPUTS

The receiver input includes a fail-safe feature that guarantees a logic high RxD output when the A and B inputs are floating or open-circuited.

## MAGNETIC FIELD IMMUNITY

Because iCouplers use coreless technology, no magnetic components are present, and the problem of magnetic saturation of the core material does not exist. Therefore, $i$ Couplers have essentially infinite dc field immunity. The following analysis defines the conditions under which this can occur. The ADM2486's 3 V operating condition is examined because it represents the most susceptible mode of operation.

The limitation on the iCoupler's ac magnetic field immunity is set by the condition in which the induced error voltage in the receiving coil (the bottom coil in this case) is made sufficiently large, either to falsely set or reset the decoder. The voltage induced across the bottom coil is given by

$$
V=\left(\frac{-d \beta}{d t}\right) \sum \pi r_{n}^{2} ; n=1,2, \ldots, N
$$

where if the pulses at the transformer output are greater than 1.0 V in amplitude:
$\beta=$ magnetic flux density (gauss).
$N=$ number of turns in receiving coil.
$r_{n}=$ radius of nth turn in receiving coil ( cm ).
The decoder has a sensing threshold of about 0.5 V ; therefore, there is a 0.5 V margin in which induced voltages can be tolerated.

Given the geometry of the receiving coil and an imposed requirement that the induced voltage is, at most, $50 \%$ of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated as shown in Figure 27.

Figure 27. Maximum Allowable External Magnetic Flux Density
For example, at a magnetic field frequency of 1 MHz , the maximum allowable magnetic field of 0.2 kGauss induces a voltage of 0.25 V at the receiving coil. This is about $50 \%$ of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse and is the worst-case polarity, it reduces the received pulse from $>1.0 \mathrm{~V}$ to 0.75 V . This is well above the 0.5 V sensing threshold of the decoder.

Figure 28 shows the magnetic flux density values in terms of more familiar quantities such as maximum allowable current flow at given distances away from the ADM2486 transformers.

Figure 28. Maximum Allowable Current for Various Current-to-ADM2486 Spacings

At combinations of strong magnetic field and high frequency, any loops formed by printed circuit board traces could induce sufficiently large error voltages to trigger the thresholds of succeeding circuitry. Care should be taken in the layout of such traces to avoid this possibility.

## APPLICATIONS INFORMATION

## PC BOARD LAYOUT

The ADM2486 isolated RS-485 transceiver requires no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see Figure 29). Bypass capacitors are most conveniently connected between Pin 1 and Pin 2 for $V_{D D 1}$ and between Pin 15 and Pin 16 for $\mathrm{V}_{\mathrm{DD} 2}$. The capacitor value should be between $0.01 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$. The total lead length between both ends of the capacitor and the input power supply pin should not exceed 20 mm . Bypassing between Pin 1 and Pin 8 and between Pin 9 and Pin 16 should also be considered unless the ground pair on each package side is connected close to the package.

Figure 29. Recommended Printed Circuit Board Layout
In applications involving high common-mode transients, care should be taken to ensure that board coupling across the isolation barrier is minimized. Furthermore, the board layout should be designed such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this could cause voltage differentials between pins exceeding the device's Absolute Maximum Ratings, thereby leading to latch-up or permanent damage.

## POWER_VALID INPUT

To avoid chatter on the A and B outputs caused by slow powerup and power-down transients on $\mathrm{V}_{\text {DD1 }}(>100 \mu \mathrm{~s} / \mathrm{V})$, the device features a power_valid (PV) digital input. This pin should be driven low until $V_{\text {DDI }}$ exceeds 2.0 V . When $\mathrm{V}_{\mathrm{DDI}}$ is greater than 2.0 V , this pin should be driven high. Conversely, upon powerdown, PV should be driven low before $\mathrm{V}_{\mathrm{DD} 1}$ reaches 2.0 V (see Figure 30).

If the PV pin is driven with an open-drain output, the recommended value for the pull-up resistor is a $10 \mathrm{k} \Omega$ resistor, bypassed with a 100 pF capacitor to $\mathrm{GND}_{1}$ (see Figure 31).

The power_valid input can be driven, for example, by the output of a system reset circuit, such as the ADM809Z, which has a threshold voltage of 2.32 V .

Figure 31. Driving PV with an Open-Drain Output

## ISOLATED POWER SUPPLY CIRCUIT

The ADM2486 requires isolated power capable of 5 V at up to approximately 75 mA (this current is dependent on the data rate and termination resistors used) to be supplied between the $\mathrm{V}_{\mathrm{DD} 2}$ and the $\mathrm{GND}_{2}$ pins.

A transformer driver circuit with a center-tapped transformer and LDO can be used to generate the isolated 5 V supply, as shown in Figure 32. The center-tapped transformer provides electrical isolation of the 5 V isolated power supply. The primary winding of the transformer is excited with a pair of square waveforms that are $180^{\circ}$ out of phase with each other. A pair of Schottky diodes and a smoothing capacitor are used to create a rectified signal from the secondary winding. The ADP667 linear voltage regulator provides a regulated 5 V power supply to the ADM2486's bus-side circuitry ( $\mathrm{V}_{\mathrm{DD} 2}$ ).
