## FEATURES

Isolated RS-485/RS-422 transceivers, configurable as half duplex or full duplex
Integrated oscillator driver for external transformer $\pm 15$ kV ESD protection on RS-485 input/output pins
Complies with TIA/EIA-485-A-98 and ISO 8482:1987(E)
Data rate: $\mathbf{5 0 0}$ kbps/16 Mbps
5 V or 3.3 V operation ( $\mathrm{V}_{\mathrm{DD} 1}$ )
256 nodes on bus
True fail-safe receiver inputs
Safety and regulatory approvals
UL recognition: $\mathbf{2 5 0 0}$ V rms for 1 minute per UL 1577
VDE certificates of conformity
DIN VVDE V 0884-10 (VDE V 0884-10):2006-12
$\mathrm{V}_{\text {IORM }}=560 \mathrm{~V}$ peak
Thermal shutdown protection
Operating temperature range: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
Wide-body, 16-lead SOIC package

## APPLICATIONS

Isolated RS-485/RS-422 interfaces
Industrial field networks
Multipoint data transmission systems

## GENERAL DESCRIPTION

The ADM2482E/ADM2487E are isolated data transceivers with $\pm 15 \mathrm{kV}$ ESD protection and are suitable for high speed, halfduplex or full-duplex communication on multipoint transmission lines. For half-duplex operation, the transmitter outputs and receiver inputs share the same transmission line. Transmitter Output Pin Y is linked externally to Receiver Input Pin A, and Transmitter Output Pin Z to Receiver Input Pin B. The parts are designed for balanced transmission lines and comply with TIA/EIA-485-A-98 and ISO 8482:1987(E).
The devices employ the Analog Devices, Inc., $i$ Coupler ${ }^{\oplus}$ technology to combine a 3-channel isolator, a three-state differential line driver, and a differential input receiver into a single package. An on-chip oscillator outputs a pair of square waveforms that drive an external transformer to provide isolated

Figure 1.
power. The logic side of the device is powered with either a 5 V or a 3.3 V supply, and the bus side is powered with an isolated 3.3 V supply.

The ADM2482E/ADM2487E driver has an active high enable, and the receiver has an active low enable. The driver output enters a high impedance state when the driver enable signal is low. The receiver output enters a high impedance state when the receiver enable signal is high.
The device has current-limiting and thermal shutdown features to protect against output short circuits and situations where bus contention might cause excessive power dissipation. The part is fully specified over the industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ and is available in a 16 -lead, wide-body SOIC package.

## SPECIFICATIONS

Each voltage is relative to its respective ground; $3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 5.5 \mathrm{~V}, 3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 3.6 \mathrm{~V}$. All minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted. All typical specifications are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD} 1}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD} 2}=3.3 \mathrm{~V}$, unless otherwise noted.

Table 1.

| COMMON-MODE TRANSIENT IMMUNITY ${ }^{1}$ |  | 25 |  | $\mathrm{kV} / \mu \mathrm{S}$ | VCM $=1 \mathrm{kV}$, transient <br> magnitude $=800 \mathrm{~V}$ |  |

${ }^{1} \mathrm{CM}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining specification-compliant operation. $\mathrm{V}_{\mathrm{CM}}$ is the common-mode potential difference between the logic and bus sides. The transient magnitude is the range over which the common-mode is slewed. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

## TIMING SPECIFICATIONS

$\mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$, unless otherwise noted.

[^0]
## ADM2482E/ADM2487E

## ABSOLUTE MAXIMUM RATINGS

Each voltage is relative to its respective ground; $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.

Table 8.

| Parameter | Rating |
| :--- | :--- |
| $V_{\mathrm{DD} 1}$ | -0.5 V to +6 V |
| $\mathrm{~V}_{\mathrm{DD} 2}$ | -0.5 V to +6 V |
| Digital Input Voltages (DE, $\overline{\mathrm{RE}, \mathrm{TxD})}$ | -0.5 V to $\mathrm{V}_{\mathrm{DD} 1}+0.5 \mathrm{~V}$ |
| Digital Output Voltages |  |
| RxD | -0.5 V to V DD1 +0.5 V |
| D1, D2 | 13 V |
| Driver Output/Receiver Input Voltage Range | -9 V to +14 V |
| Average Output Current per Pin | -35 mA to +35 mA |
| ESD (Human Body Model) on $\mathrm{A}, \mathrm{B}, \mathrm{Y}$, and | $\pm 15 \mathrm{kV}$ |
| Z pins |  |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-55^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Lead Temperature |  |
| $\quad$ Soldering (10 sec) | $300^{\circ} \mathrm{C}$ |
| Vapor Phase ( 60 sec$)$ | $215^{\circ} \mathrm{C}$ |
| Infrared (15 sec) | $220^{\circ} \mathrm{C}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

|  | ESD (electrostatic discharge) sensitive device. <br> Charged devices and circuit boards can discharge <br> without detection. Although this product features <br> patented or proprietary protection circuitry, damage <br> may occur on devices subjected to high energy ESD. <br> Therefore, proper ESD precautions should be taken to <br> avoid performance degradation or loss of functionality. |
| :--- | :--- |

## ADM2482E/ADM2487E

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Table 9. Pin Function Descriptions

| Pin No. | Mnemonic | Description |
| :---: | :---: | :---: |
| 1 | D1 | Transformer Driver Terminal 1. |
| 2 | D2 | Transformer Driver Terminal 2. |
| 3 | $\mathrm{GND}_{1}$ | Ground, Logic Side. |
| 4 | VDD1 | Power Supply, Logic Side ( 3.3 V or 5 V ). Decoupling capacitor to $\mathrm{GND}_{1}$ required; capacitor value should be between $0.01 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$. |
| 5 | RxD | Receiver Output Data. This output is high when $(A-B)>+200 \mathrm{mV}$ and low when $(A-B)<-200 \mathrm{mV}$. The output is tristated when the receiver is disabled, that is, when $\overline{\mathrm{RE}}$ is driven high. |
| 6 | $\overline{\mathrm{RE}}$ | Receiver Enable Input. This is an active low input. Driving this input low enables the receiver; driving it high disables the receiver. |
| 7 | DE | Driver Enable Input. Driving this input high enables the driver; driving it low disables the driver. |
| 8 | TxD | Transmit Data. |
| 9 | $\mathrm{GND}_{2}$ | Ground, Bus Side. |
| 10 | NC | No Connect. This pin must be left floating. |
| 11 | Y | Driver Noninverting Output. |
| 12 | Z | Driver Inverting Output. |
| 13 | B | Receiver Inverting Input. |
| 14 | A | Receiver Noninverting Input. |
| 15 | $\mathrm{GND}_{2}$ | Ground, Bus Side. |
| 16 | $\mathrm{V}_{\mathrm{DD} 2}$ | Power Supply, Bus Side (Isolated 3.3 V Supply). Decoupling capacitor to $\mathrm{GND}_{2}$ required; capacitor value should be between $0.01 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$. |

## TYPICAL PERFORMANCE CHARACTERISTICS

## ADM2482E/ADM2487E

## CIRCUIT DESCRIPTION

## ELECTRICAL ISOLATION

In the ADM2482E/ADM2487E, electrical isolation is implemented on the logic side of the interface. Therefore, the part has two main sections: a digital isolation section and a transceiver section (see Figure 30). Driver input and data enable applied to the TxD and DE pins, respectively, and referenced to logic ground $\left(\mathrm{GND}_{1}\right)$ are coupled across an isolation barrier to appear at the transceiver section referenced to isolated ground $\left(\mathrm{GND}_{2}\right)$. Similarly, the receiver output, referenced to isolated ground in the transceiver section, is coupled across the isolation barrier to appear at the RxD pin referenced to logic ground.

## iCoupler Technology

The digital signals transmit across the isolation barrier using $i$ Coupler technology. This technique uses chip scale transformer windings to couple the digital signals magnetically from one side of the barrier to the other. Digital inputs are encoded into waveforms that are capable of exciting the primary transformer winding. At the secondary winding, the induced waveforms are decoded into the binary value that was originally transmitted.

Positive and negative logic transitions at the input cause narrow pulses ( $\sim 1 \mathrm{~ns}$ ) to be sent to the decoder, via the transformer. The decoder is bistable and is, therefore, either set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than $\sim 1 \mu \mathrm{~s}$, a periodic set of refresh pulses indicative of the correct input state are sent to ensure dc correctness at the output. If the decoder receives no internal pulses for more than about $5 \mu \mathrm{~s}$, then the input side is assumed to be unpowered or nonfunctional, in which case the output is forced to a default state (see Table 10).

| On | Off | X | L or NC | H |
| Off | Off | X | L or NC | L |

## THERMAL SHUTDOWN

The ADM2482E/ADM2487E contain thermal shutdown circuitry that protects the parts from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. The thermal sensing circuitry detects the increase in die temperature under this condition and disables the driver outputs. This circuitry is designed to disable the driver outputs when a die temperature of $150^{\circ} \mathrm{C}$ is reached. As the device cools, the drivers are re-enabled at a temperature of $140^{\circ} \mathrm{C}$.

## TRUE FAIL-SAFE RECEIVER INPUTS

The receiver inputs have a true fail-safe feature that ensures that the receiver output is high when the inputs are open or shorted. During line idle conditions, when no driver on the bus is enabled, the voltage across a terminating resistance at the receiver input decays to 0 V . With traditional transceivers, receiver input thresholds specified between -200 mV and +200 mV mean that external bias resistors are required on the $A$ and $B$ pins to ensure that the receiver outputs are in a known state. The true fail-safe receiver input feature eliminates the need for bias resistors by specifying the receiver input threshold between -30 mV and -200 mV . The guaranteed negative threshold means that when the voltage between A and B decays to 0 V , the receiver output is guaranteed to be high.

## MAGNETIC FIELD IMMUNITY

The limitation on the magnetic field immunity of the $i$ Coupler is set by the condition in which an induced voltage in the receiving coil of the transformer is large enough to either falsely set or reset the decoder. The following analysis defines the conditions under which this may occur. The 3 V operating condition of the ADM2482E/ADM2487E is examined because it represents the most susceptible mode of operation.
The pulses at the transformer output have an amplitude greater than 1 V . The decoder has a sensing threshold of about 0.5 V , thus establishing a 0.5 V margin in which induced voltages can be tolerated.
The voltage induced across the receiving coil is given by

$$
V=\left(\frac{-d \beta}{d t}\right) \sum \pi r_{n}^{2} ; n=1,2, \ldots, N
$$

where:
$\beta$ is the magnetic flux density (gauss).
$N$ is the number of turns in the receiving coil. $r_{n}$ is the radius of the $\mathrm{n}^{\text {th }}$ turn in the receiving coil ( cm ).

Given the geometry of the receiving coil and an imposed requirement that the induced voltage is, at most, $50 \%$ of the 0.5 V margin at the decoder, a maximum allowable magnetic field can be determined using Figure 31.

Figure 31. Maximum Allowable External Magnetic Flux Density
For example, at a magnetic field frequency of 1 MHz , the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This is about $50 \%$ of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse and is the worst-case polarity, it reduces the received pulse from $>1.0 \mathrm{~V}$ to 0.75 V , still well above the 0.5 V sensing threshold of the decoder.

Figure 32 shows the magnetic flux density values in terms of more familiar quantities, such as maximum allowable current flow at given distances away from the ADM2482E/ADM2487E transformers.

Figure 32. Maximum Allowable Current for Various Current-to-ADM2482E/ADM2487E Spacings

With combinations of strong magnetic field and high frequency, any loops formed by PCB traces can induce error voltages large enough to trigger the thresholds of succeeding circuitry.
Care should be taken in the layout of such traces to avoid this possibility.

## ADM2482E/ADM2487E

## APPLICATIONS INFORMATION

## PRINTED CIRCUIT BOARD LAYOUT

The isolated RS-485 transceiver of the ADM2482E/ADM2487E requires no external interface circuitry for the logic interfaces. Power supply bypassing is required at the input and output supply pins (see Figure 33).

Bypass capacitors are most conveniently connected between Pin 3 and Pin 4 for $V_{\text {DDI }}$ and between Pin 15 and Pin 16 for $\mathrm{V}_{\mathrm{DD} 2}$. The capacitor value must be between $0.01 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$. The total lead length between both ends of the capacitor and the input power supply pin must not exceed 20 mm .
Bypassing Pin 9 and Pin 16 is also recommended unless the ground pair on each package side is connected close to the package.

Figure 33. Recommended Printed Circuit Board Layout
In applications involving high common-mode transients, care must be taken to ensure that board coupling across the isolation barrier is minimized. Furthermore, the board layout must be designed such that any coupling that does occur equally affects all pins on a given component side.

Failure to ensure this can cause voltage differentials between pins exceeding the absolute maximum ratings of the device, thereby leading to latch-up or permanent damage.

## TRANSFORMER SUPPLIERS

The transformer primarily used with the ADM2482E/ADM2487E must be a center-tapped transformer winding. The turns ratio of the transformer must be set to provide the minimum required output voltage at the maximum anticipated load with the minimum input voltage. Table 13 shows ADM2482E/ADM2487E transformer suppliers.

Table 13. Transformer Supplies

| Manufacturer | Primary Voltage 3.3 V | Primary Voltage 5 V |
| :--- | :--- | :--- |
| Coilcraft | DA2303-AL | GA3157 |
| Murata | $782482 / 33 \mathrm{VC}$ | $782482 / 53 \mathrm{VC}$ |

## ISOLATED POWER SUPPLY CIRCUIT

The ADM2482E/ADM2487E integrate a transformer driver that, when used with an external transformer and linear voltage regulator (LDO), generates an isolated 3.3 V power supply to be supplied between $\mathrm{V}_{\mathrm{DD} 2}$ and $\mathrm{GND}_{2}$, as shown in Figure 34.

Pin D1 and Pin D2 of the ADM2482E/ADM2487E drive a center-tapped Transformer T1. A pair of Schottky diodes and a smoothing capacitor are used to create a rectified signal from the secondary winding. The ADP3330 LDO provides a regulated 3.3 V power supply to the ADM2482E/ADM2487E bus side circuitry ( $\mathrm{V}_{\mathrm{DD} 2}$ ).
When the ADM2482E/ADM2487E are powered by 3.3 V on the logic side, a step-up transformer is required to compensate for the forward voltage drop of the Schottky diodes and the voltage drop across the regulator. The transformer turns ratio should be chosen to ensure just enough headroom for the ADP3330 LDO to output a regulated 3.3 V output under all operating conditions.

If the ADM2482E/ADM2487E are powered by 5 V on the logic side, then a step-down transformer should be used. For optimum efficiency, the transformer turns ratio should be chosen to ensure just enough headroom for the ADP3330 LDO to output a regulated 3.3 V output under all operating conditions.

## ADM2482E/ADM2487E

## TYPICAL APPLICATIONS

Figure 35 and Figure 36 show typical applications of the ADM2482E/ADM2487E in half-duplex and full-duplex RS-485 network configurations. Up to 256 transceivers can be connected to the RS- 485 bus. To minimize reflections, the
line must be terminated at the receiving end in its characteristic impedance, and stub lengths off the main line must be kept as short as possible. For a half-duplex operation, this means that both ends of the line must be terminated, because either end can be the receiving end.

Figure 35. ADM2482E/ADM2487E Typical Half-Duplex RS-485 Network
