

## FEATURES

- Physical layer CAN transceiver
- 5 V operation on  $V_{CC}$
- Complies with ISO 11898 standard
- High speed data rates up to 1 Mbps
- Short-circuit protection on CANH and CANL against shorts to power/ground in 24 V systems
- Unpowered nodes do not disturb the bus
- Connect 110 or more nodes on the bus
- Slope control for reduced EMI
- Thermal shutdown protection
- Low current standby mode
- Industrial operating temperature range ( $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ )
- Available in 8-lead SOIC package

## APPLICATIONS

- CAN data buses
- Industrial field networks
- DeviceNet applications
- CanOpen, CanKingdom

## GENERAL DESCRIPTION

The [ADM3051](#) is a controller area network (CAN) physical layer transceiver allowing a protocol layer CAN controller to access the physical layer bus. The [ADM3051](#) complies with the ISO 11898 standard. It is capable of running at data rates up to 1 Mbps.

The device has current-limiting and thermal shutdown features to protect against output short circuits and situations where the bus may be shorted to ground or power terminals in 24 V bus power systems. The part is fully specified over the industrial temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  and is available in an 8-lead SOIC package.

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

Three operating modes are available: high speed, slope control, and standby. Pin 8 (RS) is used to select the operating mode. The low current standby mode can be selected by applying a logic high to RS.

The device can be set to operate with slope control to limit EMI by connecting RS with a resistor to ground to modify the rise and fall of slopes. This mode facilitates the use of unshielded cables. Alternatively, disabling slope control by connecting RS to ground allows high speed operation. Shielded cables or other measures to control EMI are necessary in this mode.

## SPECIFICATIONS

All voltages relative to ground (Pin 2);  $4.5\text{ V} \leq V_{CC} \leq 5.5\text{ V}$ .  $T_A = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ ,  $R_L = 60\ \Omega$ ,  $I_{RS} > -10\ \mu\text{A}$ , unless otherwise noted. All typical specifications are at  $T_A = 25^\circ\text{C}$ ,  $V_{CC} = 5\text{ V}$ , unless otherwise noted.

Table 1.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
<b>SUPPLY CURRENT</b>						
Dominant State	$I_{CC}$			78	mA	$V_{TXD} = 1\text{ V}$
Recessive State				10	mA	$V_{TXD} = 4\text{ V}$ ; $R_{SLOPE} = 47\text{ k}\Omega$
Standby State			275		$\mu\text{A}$	$V_{RS} = V_{CC}$ , $I_{TXD} = I_{RXD} = I_{VREF} = 0\text{ mA}$ , $T_A < 90^\circ\text{C}$

## ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
$V_{CC}$	-0.3 V to +7 V
Digital Input Voltage TxD	-0.3 V to $V_{CC} + 0.3$ V
Digital Output Voltage RxD	-0.3 V to $V_{CC} + 0.3$ V
CANH, CANL	-36 V to +36 V
$V_{REF}$	-0.3 V to $V_{CC} + 0.3$ V
RS	-0.3 V to $V_{CC} + 0.3$ V
Operating Temperature Range	-40°C to +125°C
Storage Temperature Range	-55°C to +150°C
ESD (Human Body Model) on All Pins	4 kV
Lead Temperature	
Soldering (10 sec)	300°C
Vapor Phase (60 sec)	215°C
Infrared (15 sec)	220°C
$\theta_{JA}$ Thermal Impedance	110°C/W
$T_J$ Junction Temperature	150°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	TxD	Driver Input Data.
2	GND	Ground.
3	V <sub>CC</sub>	Power Supply. This pin requires a decoupling capacitor to GND of 100 nF.
4	RxD	Receiver Output Data.
5	V <sub>REF</sub>	Reference Voltage Output.
6	CANL	Low Level CAN Voltage Input/Output.
7	CANH	High Level CAN Voltage Input/Output.
8	RS	Slope Resistor Input.

## CIRCUIT DESCRIPTION

### CAN TRANSCEIVER OPERATION

A CAN bus has two states: dominant and recessive. A dominant state is present on the bus when the differential voltage between CANH and CANL is greater than 0.9 V. A recessive state is present on the bus when the differential voltage between CANH and CANL is less than 0.5 V. During a dominant bus state, the CANH pin is high and the CANL pin is low. During a recessive bus state, both the CANH and CANL pins are in the high impedance state.

The driver drives CANH high and CANL low (dominant state) if a logic low is present on TxD. If a logic high is present on TxD, the driver output is placed in a high impedance state (recessive state). The driver output states are shown in Table 7.

The receiver output is low if the bus is in the dominant state and high if the bus is in the recessive state. If the differential voltage between CANH and CANL is between 0.5 V and 0.9 V, the bus state is indeterminate and the receiver output may be high or low. The receiver output states for given inputs are listed in Table 8.

### OPERATIONAL MODES

Three modes of operation are available: high speed, slope control, and standby. RS (Pin 8) allows modification of the operational mode by connecting the RS input through a resistor to ground, or directly to ground, or to a CAN controller, as shown in Figure 30.

With RS connected to ground, the output transistors switch on and off at the maximum rate possible in high speed mode, with no modification to the rise and fall slopes. EMI in this mode can be alleviated using shielded cables.

Alternatively, connecting RS to a resistor,  $R_{SLOPE}$ , allows slope control mode, with the value of the resistor modifying the rise and fall slopes. The reduced EMI allows the use of unshielded cables.

Applying a logic high to RS initiates a low current standby mode. The transmitter is disabled, and the receiver is connected to a low current. RxD goes low upon receiving dominant bits, allowing an attached microcontroller that detects this to wake the transceiver via Pin 8, which returns it to standard operation. The receiver is slower in standby mode and loses the first message at higher bit rates.

**Table 5. Mode Selection Using RS Pin (Pin 8)**

Mode	Condition to Force	Resulting Voltage/Current
Standby	$V_{RS} > 0.75 V_{CC}$	$-I_{RS} < 10 \mu A$
Slope Control	$10 \mu A < -I_{RS} < 200 \mu A$	$0.4 V_{CC} < V_{RS} < 0.6 V_{CC}$
High Speed	$V_{RS} < 0.3 V_{CC}$	$-I_{RS} < -500 \mu A$

### TRUTH TABLES

The truth tables in this section use the abbreviations found in Table 6.

**Table 6. Truth Table Abbreviations**

Letter	Description
H	High level
L	Low level
X	Don't care
I	Indeterminate
Z	High impedance (off)
NC	Disconnected

**Table 7. Transmitting**

Supply	Input	Outputs		
		State	CANH	CANL
$V_{CC}$	TxD			
On	L	Dominant	H	L
On	H	Recessive	Z	Z
On	Z	Recessive	Z	Z
Off	X	Z	Z	Z

**Table 8. Receiving**

Supply	Inputs		Output
	$V_{ID} = CANH - CANL$	Bus State	RxD
$V_{CC}$			
On	$\geq 0.9 V$	Dominant	L
On	$\leq 0.5 V$	Recessive	H
On	$0.5 V < V_{ID} < 0.9 V$	I	I
On	Inputs open	Recessive	H
Off	X	X	I

### THERMAL SHUTDOWN

The ADM3051 contains thermal shutdown circuitry that protects the part from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. The thermal sensing circuitry detects the increase in die temperature under this condition and disables the driver outputs. The design of this circuitry ensures the disabling of driver outputs upon reaching a die temperature of 150°C. As the device cools, reenabling of the drivers occurs at a temperature of 140°C.

APPLICATIONS INFORMATION
