GaAs, MMIC, SPDT Switch, 10 kHz to 3 GHz

Data Sheet

HMC221B

FEATURES

Low insertion loss: 0.4 dB typical
Input third-order intercept (IP3): 55 dBm typical
Positive control: 0 V/3 V
Ultrasmall package: SOT-23

APPLICATIONS

Industrial, scientific and medical (ISM)
PCMCIA wireless cards
Cellular applications

GENERAL DESCRIPTION

The HMC221B is a single-pole, double-throw (SPDT) switch specified from 10 kHz to 3 GHz in a 6-lead SOT-23 plastic package. This switch offers a very low insertion loss of less than 0.8 dB up to 3 GHz and is well suited for receiver and filter switching applications that require low insertion loss and a small size.

The RF1 and RF2 pins are reflective shorts when in an off state, and the two control voltages (the A and B pins) require a minimal dc bias current. Note that the HMC197B exhibits a similar performance in an alternate pinout.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

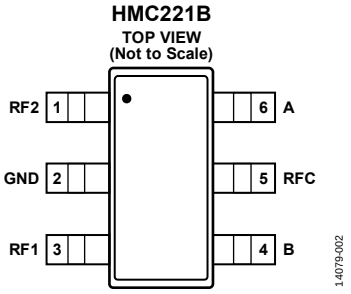

Figure 2. Pin Configuration

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	RF2	RF2 Port (See Figure 4). This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required.
2	GND	Ground (See Figure 6). This pin must be connected to the RF/dc ground of the printed circuit board (PCB).
3	RF1	RF1 Port (See Figure 4). This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required.
4	B	Control Input A (See Table 4 and Figure 5).
5	RFC	RF Common Port (See Figure 3). This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required.
6	A	Control Input B (See Table 4 and Figure 5).

Table 4. Truth Table

Control Input Voltage[1]		Signal Path State	
A (V dc)	**B (V dc)**	**RFC to RF1**	**RFC to RF2**
Low	High	On	Off
High	Low	Off	On

[1] All high or all low for control inputs, A and B, are undefined states. The switch response has a high insertion loss and poor return loss on both RF paths.

APPLICATIONS INFORMATION

EVALUATION PRINTED CIRCUIT BOARD (PCB)

Generate the circuit board used in this application with proper RF circuit design techniques. Signal lines at the RF port must have 50 Ω impedance and connect the package ground leads and package bottom directly to the ground plane similar to that shown in Figure 14. The evaluation circuit board shown Figure 14 is available from Analog Devices, Inc., upon request.

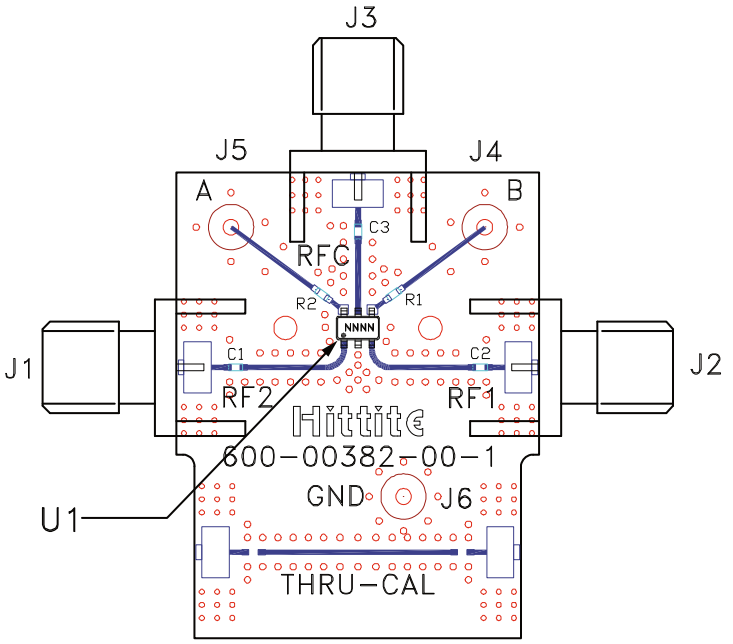

Figure 14. Evaluation PCB

TYPICAL APPLICATION CIRCUIT

Two cascaded, CMOS inverters, biased with V_{DD} = 5 V, can generate complementary control voltages, V_{CTL} = 0 V/5 V, for the A and B inputs. Therefore, the HMC221B can be controlled from a single CMOS input line (see Figure 15).
