## Precision, Wide Voltage Range, Gain Selectable Funnel Amplifier <br> DESCRIPTIOn

The LT ${ }^{\circledR}$ 1997-2 is an attenuating (funnel) difference amplifier that can be used to translate large differential signals to the low voltage range compatible with ADCs. It combines a precision operational amplifier with highly-matched resistors to form a one-chip solution to attenuate and level shift voltages accurately using no external components. It comes with three standard pin-selectable gain options ( $0.1,0.2$ and 0.25 ), which can be further combined to form gains from 0.0455 to 0.55 (attenuations of 1.82 to 22) with accuracy of $0.006 \%$ ( 60 ppm ). The LT1997-2 also works across a very wide input common-mode voltage range ( $\pm 255 \mathrm{~V}$ ), enabling robust operation in demanding industrial environments. Its excellent resistor matching results in a common mode rejection ratio of greater than 105 dB .

The resistors maintain their excellent matching over temperature; the matching temperature coefficient is guaranteed less than $1 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$. The resistors are extremely linear with voltage, resulting in a gain nonlinearity of less than 2ppm.

The LT1997-2 is fully specified at 5 V and $\pm 15 \mathrm{~V}$ supplies and from $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$. The device is available in space saving 16 -lead MSOP and $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ DFN14 packages.

## TYPICAL APPLICATION

Interfacing a $\mathbf{2 0 V}_{\text {P-p }}$ Ground-Referenced Input Signal to a 5V ADC

LT1997-2 Driving LTC2364-16, ADC, $\mathfrak{f}_{\mathrm{IN}}=1 \mathrm{kHz}, 32768$-Point FFT

## ABSOLUTE MAXIMUM RATINGS

(Note 1)

Supply Voltages ( $\mathrm{V}^{+}$to $\mathrm{V}^{-}$)........................................60V
+INA, -INA, +INB, -INB,
+INC, -INC (Note 2)........................................ $V^{-} \pm 270 \mathrm{~V}$
REF, REF1, REF2.................... ( $\mathrm{V}^{-}+60 \mathrm{~V}$ ) to ( $\mathrm{V}^{-}-0.3 \mathrm{~V}$ )
SHDN ................................... ( $\mathrm{V}^{+}+0.3 \mathrm{~V}$ ) to ( $\mathrm{V}^{-}-0.3 \mathrm{~V}$ )
Output Current (Continuous) (Note 6) ................... 50 mA
Output Short-Circuit Duration
(Note 3) $\qquad$ Thermally Limited

## Temperature Range (Notes 4, 5)

LT1997I-2. -40 to $85^{\circ} \mathrm{C}$
LT1997H-2 ............................................ 40 to $125^{\circ} \mathrm{C}$
Maximum Junction Temperature $\qquad$ $150^{\circ} \mathrm{C}$
Storage Temperature Range ..................... 65 to $150^{\circ} \mathrm{C}$
MSOP Lead Temperature (Soldering, 10 sec )........ $300^{\circ} \mathrm{C}$

## PIn CONFIGURATION

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: See Common Mode Voltage Range in the Applications Information section of this data sheet for other considerations when taking +INA/ -INA/+INB/-INB/+INC/-INC pins to $\pm 270 \mathrm{~V}$.
Note 3: A heat sink may be required to keep the junction temperature below absolute maximum. This depends on the power supply, input voltages and the output current.
Note 4: The LT1997I-2 is guaranteed functional over the operating temperature range of $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$. The LT1997H-2 is guaranteed functional over the operating temperature range of $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$.
Note 5: The LT19971-2 is guaranteed to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$. The LT1997H-2 is guaranteed to meet specified performance from $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$.

Note 6: This parameter is not $100 \%$ tested.
Note 7: The input voltage range is guaranteed by the $\pm 25 \mathrm{~V}$ CMRR tests. The Input Voltage Range numbers specified in the table guarantee that the internal op amp operates in its normal operating region. The Input voltage range can be higher if the internal op amp operates in its Over-The-Top ${ }^{\circledR}$ operating region. See Common Mode Voltage Range in the Applications Information section to determine the valid input voltage range under various operating conditions.
Note 8: Input impedance is tested by a combination of direct measurements and correlation to the CMRR and gain error tests.
Note 9: Offset voltage, offset voltage drift and PSRR are defined as referred to the internal op amp. The following shows the calculation of output offset: In the case of balanced source resistance, $\mathrm{V}_{\text {OS,OUT }}=\left(\mathrm{V}_{\text {OS }}\right.$ - NOISEGAIN $)+\left(l_{O S} \bullet 25 k\right)+\left(I_{B} \bullet 25 k \bullet\left(1-R_{P} / R_{N}\right)\right)$ where $R_{p}$ and $R_{N}$ are the total resistance at the op amp positive and negative terminal, respectively.

## PIn fUnCTIOnS (DFN/MSOP)

$V^{+}$(Pin 9/Pin 11): Positive Supply Pin.
$V^{-}$(EXPOSED PAD Pin 15/Pin 8): Negative Supply Pin.
OUT (Pin 8/Pin 9): Output Pin.
+INA (Pin 1/Pin 1): Noninverting Gain-of-0.1 Input Pin. Connects a 250 k internal resistor to the internal op amp's noninverting input.
+INB (Pin 3/Pin 3): Noninverting Gain-of-0.2 Input Pin. Connects a 125 k internal resistor to the internal op amp's noninverting input.
+INC (Pin 5/Pin 5): Noninverting Gain-of-0.25 Input Pin. Connects a 100 k internal resistor to the internal op amp's noninverting input.
-INA (Pin 14/Pin 16): Inverting Gain-of-0.1 input Pin. Connects a 250k internal resistor to the internal op amp's inverting input.
-INB (Pin 12/Pin 14): Inverting Gain-of-0.2 input Pin. Connects a 125 k internal resistor to the internal op amp's inverting input.
-INC (Pin 10/Pin 12): Inverting Gain-of-0.25 input Pin. Connects a 100k internal resistor to the internal op amp's inverting input.
REF (Pin 7/NA): Reference Input Pin. Sets the output level when the difference between the inputs is zero.
REF1 (NA/Pin 6): Reference 1 InputPin. With REF2, sets the output level when the difference between the inputs is zero.
REF2 (NA/Pin 7): Reference 2 InputPin. With REF1, sets the output level when the difference between the inputs is zero.
$\overline{\text { SHDN }}$ (Pin 6/Pin 10): Shutdown Pin. Amplifier is active when this pin is tied to $\mathrm{V}^{+}$or left floating. Pulling the pin more than 2.5 V below $\mathrm{V}^{+}$causes the amplifier to enter a low power state.

## BLOCK DIAGRAM

## APPLICATIONS INFORMATION

Figure 1. Difference Amplifier with Dual-Supply Operation (Gain = 0.1)

## Introduction

The LT1997-2 is a precision, high voltage funnel amplifier combined with a highly-matched resistor network. It can easily be configured into many different gain circuits without adding external components, as it will be shown in this data sheet. The LT1997-2 provides the resistors and op amp together in a small package in order to save board space and reduce complexity. Highly accurate measurement circuits can be easily constructed with the LT1997-2. The circuits can be tailored to specific measurement applications.

## Common Mode Voltage Range

The common mode voltage range of the LT1997-2 is set by the voltage range allowed on the LT1997-2's input pins and by the input voltage range of the internal op amp.
The internal op amp of LT1997-2 has 2 operating regions:
a) if the common-mode voltage at the inputs of the internal op amp ( $\mathrm{V}_{\text {CMOP }}$ ) is between $\mathrm{V}^{-}$and $\mathrm{V}^{+}-1.75 \mathrm{~V}$, the op amp operates in its normal region;
b) If $\mathrm{V}_{\text {CMOP }}$ is between $\mathrm{V}^{+}-1.75 \mathrm{~V}$ and $\mathrm{V}^{-}+76 \mathrm{~V}$, the op amp continues to operate, but in its Over-The-Top (OTT) region with degraded performance (see Over-The-Top Operation section of this data sheet for more detail).
The LT1997-2 will not operate correctly if the commonmode voltage at the inputs of the internal op amp ( $\mathrm{V}_{\text {смOP }}$ )
is below $\mathrm{V}^{-}$, but the part will not be damaged as long as $\mathrm{V}_{\text {CMOP }}$ is greater than $\mathrm{V}^{-}-25 \mathrm{~V}$ and the junction temperature of the LT1997-2 does not exceed $150^{\circ} \mathrm{C}$.

The voltage on LT1997-2's input pins should never be higher than $\mathrm{V}^{-}+270 \mathrm{~V}$ or lower than $\mathrm{V}^{-}-270 \mathrm{~V}$ under any circumstances.

The common-mode voltage at the inputs of the internal op amp ( $\mathrm{V}_{\mathrm{CMOP}}$ ) is determined by the voltages on pins +INA, +INB, +INC and REF (see the Calculating Input Voltage Range section). This condition is true provided that the internal op amp's output is not clipped and feedback maintains the internal op amp's inputs at the same voltage.
In addition to the limits mentioned above, the common mode input voltage of the amplifier should be chosen so that the input resistors do not dissipate too much power. The power dissipated in a 250 k resistor must be less than 1.8 W . It must be less than 0.9 W for the 125 k resistor and less than 0.72 W for the 100 k resistor. For most applications, the pin voltage limitations will be reached before the resistor power limitation is reached.

## Calculating Input Voltage Range

Figure 2 shows the LT1997-2 in the generalized case of a difference amplifier, with the inputs shorted for the common mode calculation. The values of $R_{F}$ and $R_{G}$ are dictated by how the positive inputs (+INA, +INB, +INC) and REF pin are connected.
By superposition we can write:

$$
V_{C M O P}=V_{E X T} \cdot \frac{R_{F}}{R_{F}+R_{G}}+V_{R E F} \cdot \frac{R_{G}}{R_{F}+R_{G}}
$$

Or, solving for $\mathrm{V}_{\mathrm{EXT}}$ :

$$
V_{E X T}=V_{C M O P} \cdot\left(1+\frac{R_{G}}{R_{F}}\right)-V_{R E F} \cdot \frac{R_{G}}{R_{F}}
$$

But valid $\mathrm{V}_{\mathrm{CMOP}}$ voltages are limited to $\mathrm{V}_{\mathrm{S}^{+}}-1.75 \mathrm{~V}$ (or $V_{S^{-}}+76 \mathrm{~V}$ for 0 T ) on the high side and $\mathrm{V}_{S^{-}}$on the low side, so:

$$
\operatorname{MAX} V_{E X T}=\left(V_{S^{+}}-1.75\right) \cdot\left(1+\frac{R_{G}}{R_{F}}\right)-V_{R E F} \cdot \frac{R_{G}}{R_{F}}
$$

## APPLICATIONS INFORMATION

and:

Figure 2. Calculating the Common Mode Input Voltage Range
Exceeding the MAX $V_{\text {EXT }}$ limit will cause the amplifier to transition into the Over-The-Top region. The maximum input voltage for the Over-The-Top region is:

$$
\text { MAX } V_{E X T O T T}=\left(V_{S^{-}}+76\right) \cdot\left(1+\frac{R_{G}}{R_{F}}\right)-V_{R E F} \cdot \frac{R_{G}}{R_{F}}
$$

Keep in mind that the above MAX and MIN values for input voltage range should not exceed $\mathrm{V}^{-} \pm 270 \mathrm{~V}$, the ABSMAX voltage range specified earlier for LT1997-2's input pins.

The negative inputs (-INA, -INB, -INC) are not limited by the internal op amp common mode range (VCMOP) because they do not affect it. They are limited by the output swing of the amplifier (and obviously by the allowed voltage range for the input pins).

## Over-The-Top Operation

When the input common mode voltage of the internal op amp ( $\mathrm{V}_{\text {CMOP }}$ ) in the LT1997-2 is biased near or above the $\mathrm{V}^{+}$supply, the op amp is operating in the Over-The-Top (OTT) region. The op amp continues to operate with an input common mode voltage of up to 76 V above $\mathrm{V}^{-}$(regardless of the positive power supply voltage $\mathrm{V}^{+}$), but its performance is degraded. The op amp's input bias currents change from under $\pm 2 n A$ to $14 \mu A$. The op amp's input offset current rises to $\pm 50 \mathrm{nA}$, which adds $\pm 1.25 \mathrm{mV}$ to the output offset voltage.

In addition, when operating in the Over-The-Top region, the differential input impedance of the internal op amp decreases from $1 \mathrm{M} \Omega$ in normal operation to approximately $3.7 \mathrm{k} \Omega$ in Over-The-Top operation. This resistance appears
across the summing nodes of the internal op amp and boosts noise and offset while decreasing speed. Noise and offset will increase by $80 \%$. The bandwidth will be reduced by $45 \%$. For more detail on Over-The-Top operation, consult the LT6015 data sheet.

## Difference Amplifiers

The LT1997-2 is ideally suited to be used as a difference amplifier. Figure 3 shows the basic 4 -resistor difference amplifier and the LT1997-2. A difference gain of 0.2 (attenuation $=5$ ) is shown, but can be altered by additional dashed connections. By connecting the 100k resistors in parallel with the 25 k feedback resistors, the gain is reduced to 0.16 (attenuation $=6.25$ ). Of course there are many possible gains and Figure 4 shows circuit schematics of some of those difference amplifier gains.

Note that the common mode voltage at the inputs of the internal op amp ( $\mathrm{V}_{\text {CMOP }}$ ) is set by the voltages at pins +INA, +INB, +INC and REF.

DIFFERENCE AMPLIFIER CONFIGURATION

DIFFERENCE AMPLIFIER CONFIGURATION
IMPLEMENTED WITH THE LT1997-2, $R_{F}=25 \mathrm{k}, \mathrm{R}_{\mathrm{G}}=125 \mathrm{k}, \mathrm{GAIN}=0.2$
ADDING THE DASHED CONNECTIONS CONNECT THE
100k RESISTOR IN PARALLEL WITH R $\mathrm{F}_{\mathrm{F}}$, SO R $\mathrm{R}_{\mathrm{F}}$ IS REDUCED TO 20k. THE GAIN BECOMES $20 \mathrm{k} / 125 \mathrm{k}=0.16$

Figure 3. The LT1997-2 Configured as a Difference Amplifier. Gain Is Set by Connecting the Correct Resistors or Combinations of Resistors. Gain of 0.2 (Attenuation =5) Is Shown, with Dashed Lines Modifying It to a Gain of 0.16 (Attenuation $=6.25$ )

## APPLICATIONS INFORMATION

Figure 4. Many Difference Amplifier Gains Can Be Achieved by Strapping Pins

## LT 1997-2

## APPLICATIONS INFORMATION

## Difference Amplifier: Additional Gains Using CrossCoupling

Figure 5 shows the basic difference amplifier as well as the LT1997-2 with cross-coupled inputs. The additional dashed connections reduce the differential gain from 0.25 to 0.15 . Using this method, additional gains are achievable and a few example schematics of the difference amplifiers using cross-coupling are shown in Figure 6. To summarize, Table 1 shows a complete list of all difference amplifier gains (attenuations) and how they are constructed using (both conventional or cross-coupling) pin strapping. Note that there are 38 unique gains ranging from 0.0455 to 0.55 (corresponding to attenuations from 1.8182 to 22) which can be achieved with the LT1997-2 using no external components.

DIFFERENCE AMPLIFIER CONFIGURATION

DIFFERENCE AMPLIFIER CONFIGURATION
IMPLEMENTED WITH THE LT1997-2, $\mathrm{R}_{\mathrm{F}}=25 \mathrm{k}, \mathrm{R}_{\mathrm{G}}=100 \mathrm{k}, \mathrm{GAIN}=0.25$ GAIN CAN BE ADJUSTED BY CROSS-COUPLING THE INPUTS. MAKING THE DASHED CONNECTIONS REDUCES THE GAIN FROM 0.25 TO 0.15

Figure 5. Cross-Coupling of the LT1997-2 Allows Additional Gains to Be Constructed

## APPLICATIONS INFORMATION

Figure 6. Examples of More Difference Amplifier Gains That Can Be Achieved

## APPLICATIONS INFORMATION

plies. Tying REF1 to $\mathrm{V}_{\mathrm{S}^{+}}$and REF2 to $\mathrm{V}_{\mathrm{S}^{-}}$produces the desired mid-supply voltage without the help of another external reference voltage (Figure 7). The ratio of RREF1 to $R_{\text {REF2 }}$ is very precise:

$$
\frac{\Delta R}{R}=\left|\frac{R_{\text {REF1 }}-R_{\text {REF2 }}}{\left(\frac{R_{\text {REF } 1}+R_{\text {REF2 }}}{2}\right)}\right|<90 \mathrm{ppm}
$$

## Shutdown

The LT1997-2 has a shutdown pin ( $\overline{\text { SHDN }}$ ). Under normal operation this pin should be tied to $\mathrm{V}^{+}$or allowed to float. Tying this pin 2.5 V or more below $\mathrm{V}^{+}$will cause the part to enter a low power state. The supply current is reduced to less than $25 \mu \mathrm{~A}$ and the op amp output becomes high impedance. The voltages at the input pins can still be present even in shutdown mode.

## Supply Voltage

The positive supply pin of the LT1997-2 should be bypassed with a small capacitor (typically $0.1 \mu \mathrm{~F}$ ) as close to the supply pins as possible. When driving heavy loads, an additional $4.7 \mu \mathrm{~F}$ electrolytic capacitor should be added. When using split supplies, the same is true for the $\mathrm{V}^{-}$supply pin.

## Output

The output of the LT1997-2 can typically swing to within 50 mV of either rail with no load and is capable of sourcing and sinking approximately 30 mA at $25^{\circ} \mathrm{C}$. The LT1997-2 is internally compensated to drive at least 0.5 nF of capacitance under any output loading conditions. For larger capacitive loads, a $0.22 \mu \mathrm{~F}$ capacitor in series with a $150 \Omega$ resistor between the output and ground will compensate the amplifier to drive capacitive loads greater than $0.5 n \mathrm{~F}$.

## Distortion

The LT1997-2 features excellent distortion performance when the internal op amp is operating in the normal operating region. Operating the LT1997-2 with the internal op amp in the over the top region will increase distortion due to the lower loop gain of the op amp. Operating the

LT1997-2 with input common mode voltages that go from the normal to Over-The-Top operation will significantly degrade the LT1997-2's linearity as the op amp must transition between two different input stages. Driving resistive loads significantly smaller than the 25k internal feedback resistor will also degrade the amplifier's linearity performance.

## High Voltage Pin Spacing

For applications with very high input voltages, the LT1997-2 pinout eases the printed circuit board (PCB) layout burden. Voltages at +INA, -INA, +INB, and -INB input pins are separated from other pins by virtue of unpopulated pin locations, as illustrated in the Pin Configuration section of this data sheet.

## Power Dissipation Considerations

Because of the ability of the LT1997-2 to operate on power supplies up to $\pm 25 \mathrm{~V}$, to withstand very high input voltages and to drive heavy loads, there is a need to ensure the die junction temperature does not exceed $150^{\circ} \mathrm{C}$. The LT1997-2 is housed in DF14 $\left(\theta_{\mathrm{JA}}=45^{\circ} \mathrm{C} / \mathrm{W}, \theta_{\mathrm{JC}}=3^{\circ} \mathrm{C} / \mathrm{W}\right)$ and MS16 $\left(\theta_{\mathrm{JA}}=130^{\circ} \mathrm{C} / \mathrm{W}\right)$ packages.
In general, the die junction temperature $\left(T_{J}\right)$ can be estimated from the ambient temperature ( $\mathrm{T}_{\mathrm{A}}$ ), the device's power dissipation $\left(\mathrm{P}_{\mathrm{D}}\right)$ and the thermal resistance of the device and board ( $\theta_{\mathrm{JA}}$ ).

$$
T_{J}=T_{A}+P_{D} \bullet \theta_{J A}
$$

The thermal resistance from the junction to the ambient environment $\left(\theta_{\mathrm{JA}}\right)$ is the sum of the thermal resistance from the junction to the exposed pad ( $\theta_{\mathrm{Jc}}$ ) and the thermal resistance from the exposed pad to the ambient environment $\left(\theta_{C A}\right)$. The $\theta_{C A}$ value depends on how much PCB metal is connected to the exposed pad in the board. The more PCB metal that is used, the lower $\theta_{\mathrm{CA}}$ and $\theta_{\mathrm{JA}}$ will be.
Power is dissipated by the amplifier's quiescent current, by the output current driving a resistive load, and by the input current driving the LT1997-2's internal resistor network.

$$
P_{D}=\left(\left(V_{S^{+}}-V_{S^{-}}\right) \bullet I_{S}\right)+P_{0 D}+P_{R E S D}
$$

## APPLICATIONS INFORMATION

For a given supply voltage, the worst-case output power dissipation $\mathrm{P}_{\mathrm{OD}(\mathrm{MAX})}$ Occurs with the output voltage at half of either supply voltage. $\mathrm{P}_{\mathrm{OD}(\mathrm{MAX})}$ is given by:

$$
P_{O D(M A X)}=\frac{\left(V_{S} / 2\right)^{2}}{R_{\text {LOAD }}}
$$

The power dissipated in the internal resistors ( $\mathrm{P}_{\text {RESD }}$ ) depends on the manner the input resistors have been configured as well as the input voltage, the output voltage and the voltage on the REF pin. The following equations and Figure 8 show the different components of $P_{\text {RESD }}$ corresponding to the different groups of the LT1997-2's internal resistors, assuming that the LT1997-2 is used with a dual supply configuration with REF pin at ground (refer to Figure 3 for resistor terminologies used in equations below).

$$
\begin{aligned}
& P_{\text {RESDA }}=\frac{\left(V_{+I N}\right)^{2}}{R_{G}+R_{F}} \\
& P_{\text {RESDB }}=\frac{\left(V_{-I N}-V_{+I N} \bullet \frac{R_{F}}{R_{G}+R_{F}}\right)^{2}}{R_{G}} \\
& P_{\text {RESDC }}=\frac{\left(V_{+I N} \bullet \frac{R_{F}}{R_{G}+R_{F}}-V_{O U T}\right)^{2}}{R_{F}} \\
& P_{\text {RESD }}=P_{\text {RESDA }}+P_{\text {RESDB }}+P_{\text {RESDC }}
\end{aligned}
$$

In general, $\mathrm{P}_{\text {RESD }}$ increases with higher input voltage and lower output and REF pin voltages.
Example: For an LT1997-2 in a DFN package mounted on a PC board with a thermal resistance of $45^{\circ} \mathrm{C} / \mathrm{W}$, operating on $\pm 25 \mathrm{~V}$ supplies and driving a $2.5 \mathrm{k} \Omega$ load to 12.5 V with
$V_{+1 N}=255 \mathrm{~V}$ and $\mathrm{REF}=0 \mathrm{~V}$, the total power dissipation is given by:

$$
\begin{aligned}
P_{D} & =(50 \cdot 0.6 \mathrm{~mA})+\frac{12.5^{2}}{2.5 \mathrm{k}}+\frac{255^{2}}{275 \mathrm{k}} \\
& +\frac{\left(130-\frac{255}{11}\right)^{2}}{250 \mathrm{k}}+\frac{\left(\frac{255}{11}-12.5\right)^{2}}{25 \mathrm{k}} \\
& =0.38 \mathrm{~W}
\end{aligned}
$$

Assuming a thermal resistance of $45^{\circ} \mathrm{C} / \mathrm{W}$, the die temperature will experience an $17^{\circ} \mathrm{C}$ rise above ambient. This implies that the maximum ambient temperature the LT1997-2 should operate under the above conditions is:

$$
\mathrm{T}_{\mathrm{A}}=150^{\circ} \mathrm{C}-17^{\circ} \mathrm{C}=133^{\circ} \mathrm{C}
$$

It is recommended that the exposed pad of the DFN package have as much PCB metal connected to it as reasonably available. The more PCB metal connected to the exposed

Figure 8. Power Dissipation Example

## APPLICATIONS INFORMATION

pad, the lower the thermal resistance. Connecting a large amount of PCB metal to the exposed pad can reduce the $\theta_{\mathrm{JA}}$ to even less than $45^{\circ} \mathrm{C} / \mathrm{W}$. Use multiple vias from the exposed pad to the $\mathrm{V}^{-}$plane. The exposed pad is electrically connected to the $\mathrm{V}^{-}$pin. In addition, a heat sink may be necessary if operating near maximumjunctiontemperature.
The MSOP package has no exposed pad and a higher thermal resistance ( $\theta_{\mathrm{JA}}=130^{\circ} \mathrm{C} / \mathrm{W}$ ). It should not be used in applications which have a high ambient temperature, require driving a heavy load, or require an extreme input voltage.

## Thermal Shutdown

For safety, the LT1997-2 will enter shutdown mode when the die temperature rises to approximately $163^{\circ} \mathrm{C}$. This thermal shutdown has approximately $9^{\circ} \mathrm{C}$ of hysteresis requiring the die temperature to $\operatorname{cool} 9^{\circ} \mathrm{C}$ before enabling the amplifier again.

## ESD Protection

The LT1997-2 is protected by a number of ESD structures. The structures are shown in Figure 9.

Figure 9. ESD Protection

The ESD structures serve to protect the internal circuitry butalso limit signal swing on certain nodes. The structures on the internal op amp inputs limit the voltage on these nodes to 0.3 V below $\mathrm{V}^{-}$and 80 V above $\mathrm{V}^{-}$. The voltage on the REF (DFN), REF1 (MSOP) and REF2 (MSOP) pins are limited to 0.3 V below $\mathrm{V}^{-}$and 60 V above $\mathrm{V}^{-}$. The voltage on the $\overline{\mathrm{SHDN}}$ pin is limited to 0.3 V below $\mathrm{V}^{-}$and 0.3 V above $\mathrm{V}^{+}$.

## Direct Line Voltage Measurement

Since the LT1997-2 can withstand up to $\pm 255 \mathrm{~V}$ at its input pins, configurations with the highest attenuation factors allow for direct sensing of the $60 \mathrm{~Hz}, 120 \mathrm{VAC}$ line voltage. The circuit shown in Figure 10 directly measures the line and neutral signals. The ground of the circuit can reasonably connect to earth ground. The neutral voltage level will typically hover near earth. The ability of the LT1997-2 to sense high voltages with varying common mode levels enables this extremely simple implementation.

## High Side Large Voltage Measurement

In some applications, an electrical potential develops relative to a high line voltage. As an example, some LED current control power conversion topologies place the LED at the high voltage. Even more interestingly, the high line may be moving. Off-line LED conversion such as in modern light bulbs sometimes use LEDs pegged to the rectified line voltage.
The circuit in Figure 11 uses the LT3590 to control LED current. A LT1997-2 configured for a gain of $0.08 \mathrm{~V} / \mathrm{V}$ can enable detection of an LED open circuit fault condition. With the LED open circuited, the voltage across the LED (which is being sensed by the LT1997-2) rises, and at 41.25 V the LT1997-2 output rises above 3.3 V , indicating a fault condition.

A large voltage referred to the rectified AC mains can be attenuated and shifted to a system's low voltage circuitry. Figure 12 shows this kind of function. Off-line LED lighting that employs nonisolated buck power conversion is one such example.

Precision Over-The-Top Single-Supply Funnel Amplifier

PACKAGE DESCRIPTION

DF Package
14(12)-Lead Plastic DFN (4mm $\times 4 \mathrm{~mm}$ )
(Reference LTC DWG \# 05-08-1963 Rev Ø)

RECOMMENDED SOLDER PAD PITCH AND DIMENSIONS APPLY SOLDER MASK TO AREAS THAT ARE NOT SOLDERED

## PACKAGE DESCRIPTION

MS Package
16 (12)-Lead Plastic MSOP with 4 Pins Removed
(Reference LTC DWG \# 05-08-1847 Rev B)

2. DRAWING NOT TO SCALE
3. DIMENSION DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS

MOLD FLASH, PROTRUSIONS OR GATE BURRS SHALL NOT EXCEED 0.152mm (.006") PER SIDE
4. DIMENSION DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSIONS.

INTERLEAD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.152 mm (.006") PER SIDE
5. LEAD COPLANARITY (BOTTOM OF LEADS AFTER FORMING) SHALL BE 0.102 mm (.004") MAX
