# Boost/SEPIC/Inverting DC/DC Converter with 1A, 65V Switch, Soft-Start and Synchronization <br> <br> DESCRIPTIOn 

 <br> <br> DESCRIPTIOn}

## feATURES

- 1A, 65V Power Switch
- Adjustable Switching Frequency
- Single Feedback Resistor Sets Vout
- Synchronizable to External Clock
- High Gain SHDN Pin Accepts Slowly Varying Input Signals
- Wide Input Voltage Range: 2.55 V to 40 V
- Low $V_{\text {CESAT }}$ Switch: 400 mV at 0.75 A (Typical)
- Integrated Soft-Start Function
- Easily Configurable as a Boost, SEPIC, or Inverting Converter
- User Configurable Undervoltage Lockout (UVLO)
- Pin Compatible with LT3580
- Tiny Thermally Enhanced 8 -Lead $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN and 8-Lead MSOP Packages
- AEC-Q100 Qualified for Automotive Applications

## APPLICATIONS

- VFD Bias Supplies
- TFT-LCD Bias Supplies
- GPS Receivers
- DSL Modems
- Local Power Supply

The LT $\odot 5580$ is a PWM DC/DC converter containing an internal 1A, 65 V switch. The LT8580 can be configured as either a boost, SEPIC or inverting converter.
The LT8580 has an adjustable oscillator, set by a resistor from the RT pin to ground. Additionally, the LT8580 can be synchronized to an external clock. The switching frequency of the part may be free running or synchronized, and can be set between 200 kHz and 1.5 MHz .
The LT8580 also features innovative $\overline{\text { SHDN }}$ pin circuitry that allows for slowly varying input signals and an adjustable undervoltage lockout function.
Additional features such as frequency foldback and soft-start are integrated. The LT8580 is available in tiny thermally enhanced $3 \mathrm{~mm} \times 3 \mathrm{~mm} 8$-lead DFN and 8 -lead MSOP packages.

## TYPICAL APPLICATION

1.5MHz, 5V to 12V Boost Converter

Efficiency and Power Loss

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: The LT8580E is guaranteed to meet performance specifications from $0^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ junction temperature. Specifications over the $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ operating junction temperature range are assured by design, characterization and correlation with statistical process controls. The LT8580I is guaranteed over the full $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ operating junction temperature range. The LT8580H is guaranteed over the full $-40^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$ operating junction temperature range. Operating lifetime is derated at junction temperatures greater than $125^{\circ} \mathrm{C}$.

Note 3: Current limit guaranteed by design and/or correlation to static test.
Note 4: Current limit measured at equivalent of listed switching frequency.
Note 5: This IC includes overtemperature protection that is intended to protect the device during momentary overload conditions. Junction temperature will exceed $150^{\circ} \mathrm{C}$ when overtemperature protection is active. Continuous operation above the specified maximum operating junction temperature may impair device reliability.

## PIn fUnCTIONS

FBX (Pin 1): Positive and Negative Feedback Pin. For a noninverting or inverting converter, tie a resistor from the FBX pin to $\mathrm{V}_{\text {OUT }}$ according to the following equations:

$$
\begin{aligned}
& \mathrm{R}_{\mathrm{FBX}}=\frac{\left(\mathrm{V}_{\text {OUT }}-1.204 \mathrm{~V}\right)}{83.3 \mu \mathrm{~A}} ; \text { Noninverting Converter } \\
& \mathrm{R}_{\mathrm{FBX}}=\frac{\left(\left|\mathrm{V}_{\text {OUT }}\right|+3 \mathrm{mV}\right)}{83.3 \mu \mathrm{~A}} ; \text { Inverting Converter }
\end{aligned}
$$

VC (Pin 2): Error Amplifier Output Pin. Tie external compensation network to this pin.
$V_{\text {IN }}$ (Pin 3): Input Supply Pin. Must be locally bypassed.
SW (Pin 4): Switch Pin. This is the collector of the internal NPN Power switch. Minimize the metal trace area connected to this pin to minimize EMI.
$\overline{\text { SHDN }}$ (Pin 5): Shutdown Pin. In conjunction with the UVLO (undervoltage lockout) circuit, this pin is used to enable/disable the chip and restart the soft-start
sequence. Drive below 1.21 V to disable the chip. Drive above 1.40 V to activate the chip and restart the soft-start sequence. Do not float this pin.
RT (Pin 6): Timing Resistor Pin. Adjusts the switching frequency. Place a resistor from this pin to ground to set the frequency to a fixed free running level. Do not float this pin.

SS (Pin7): Soft-Start Pin. Place a soft-start capacitor here. Upon start-up, the SS pin will be charged by a (nominally) 280k resistor to about 2.1V.

SYNC (Pin 8): To synchronize the switching frequency to an outside clock, simply drive this pin with a clock. The high voltage level of the clock needs to exceed 1.3V, and the low level should be less 0.4 V . Drive this pin to less than 0.4 V to revert to the internal free-running clock. See the Applications Information section for more information.

GND (Exposed Pad Pin 9): Ground. Exposed pad must be soldered directly to local ground plane.

## BLOCK DIAGRAM

## OPERATION

The LT8580 uses a constant-frequency, current modecontrol scheme to provide excellent line and load regulation. Refer to the Block Diagram for the following description of the part's operation. At the start of each oscillator cycle, the SR latch (SR1) is set, which turns on the power switch, Q1. The switch current flows through the internal current sense resistor, generating a voltage proportional to the switch current. This voltage (amplified by A4) is added to a stabilizing ramp and the resulting sum is fed into the positive terminal of the PWM comparator A3. When this voltage exceeds the level at the negative input of A3, the SR latch is reset, turning off the power switch. The level at the negative input of A 3 (VC pin) is set by the error amplifier A1 (or A2) and is simply an amplified version of the difference between the feedback voltage (FBX pin) and the reference voltage (1.204V or 3mV, depending on the configuration). In this manner, the error amplifier sets the correct peak current level to keep the output in regulation.
The LT8580 has an FBX pin architecture that can be used for either noninverting or inverting configurations. When configured as a noninverting converter, the FBX pin is pulled up to the internal bias voltage of 1.204 V by the $R_{\text {FBX }}$ resistor connected from $V_{\text {OUT }}$ to $F B X$. Amplifier A2 becomes inactive and amplifier A1 performs the inverting amplification from FBX to VC. When the LT8580 is in

Figure 1. SEPIC Topology Allows for the Input to Span the Output Voltage. Coupled or Uncoupled Inductors Can Be Used. Follow Noted Phasing if Coupled
an inverting configuration, the FBX pin is pulled down to 3 mV by the $\mathrm{R}_{\mathrm{FBX}}$ resistor connected from $\mathrm{V}_{\text {OUT }}$ to FBX . Amplifier A1 becomes inactive and amplifier A2 performs the noninverting amplification from FBX to VC.

## SEPIC Topology

As shown in Figure 1, the LT8580 can be configured as a SEPIC (single-ended primary inductance converter). This topology allows for the input to be higher, equal, or lower than the desired output voltage. Output disconnect is inherently built into the SEPIC topology, meaning no DC path exists between the input and output. This is useful for applications requiring the output to be disconnected from the input source when the circuit is in shutdown.

## Inverting Topology

The LT8580 can also work in a dual inductor inverting topology, as shown in Figure 2. The part's unique feedback pin allows for the inverting topology to be built by simply changing the connection of external components. This solution results in very low output voltage ripple due to the inductor L2 in series with the output. Abrupt changes in output capacitor current are eliminated because the output inductor delivers current to the output during both the off-time and the on-time of the LT8580 switch.

Figure 2. Dual Inductor Inverting Topology Results in Low Output Ripple. Coupled or Uncoupled Inductors Can Be Used. Follow Noted Phasing if Coupled

## operation

## Start-Up Operation

Several functions are provided to enable a very clean start-up for the LT8580.

- First, the $\overline{\mathrm{SHDN}}$ pin voltage is monitored by an internal voltage reference to give a precise turn-on voltage level. An external resistor (or resistor divider) can be connected from the input power supply to the $\overline{\text { SHDN }}$ pin to provide a user-programmable undervoltage lockout function.
- Second, the soft-start circuitry provides for a gradual ramp-up of the switch current. When the part is brought out of shutdown, the external SS capacitor is first discharged (providing protection against SHDN pin glitches and slow ramping), then an integrated 280k resistor pulls the SS pin up to $\sim 2.1 \mathrm{~V}$. By connecting an external capacitor to the SS pin, the voltage ramp rate on the pin can be set. Typical values for the soft-start capacitor range from 100 nF to $1 \mu \mathrm{~F}$.
- Finally, the frequency foldback circuit reduces the switching frequency when the FBX pin is in a nominal range
of 300 mV to 920 mV . This feature reduces the minimum duty cycle that the part can achieve thus allowing better control of the switch current during start-up. When the FBX voltage is pulled outside of this range, the switching frequency returns to normal.

## Current Limit and Thermal Shutdown Operation

The LT8580 has a current limit circuit not shown in the Block Diagram. The switch current is constantly monitored and not allowed to exceed the maximum switch current at a given duty cycle (see the Electrical Characteristics table). If the switch current reaches this value, the SR latch (SR1) is reset regardless of the state of the comparator (A1/ A2). Also, not shown in the Block Diagram is the thermal shutdown circuit. If the temperature of the part exceeds approximately $165^{\circ} \mathrm{C}$, the SR2 latch is set regardless of the state of the amplifier (A1/A2). When the part temperature falls below approximately $160^{\circ} \mathrm{C}$, a full soft-start cycle will then be initiated. The current limit and thermal shutdown circuits protect the power switch as well as the external components connected to the LT8580.

## APPLICATIONS INFORMATION

## Setting Output Voltage

The output voltage is set by connecting a resistor ( $\mathrm{R}_{\mathrm{FBX}}$ ) from $V_{\text {OUT }}$ to the $F B X$ pin. $R_{F B X}$ is determined from the following equation:

$$
R_{F B X}=\frac{\left|V_{O U T}-V_{F B X}\right|}{83.3 \mu A}
$$

where $\mathrm{V}_{\text {FBX }}$ is 1.204 V (typical) for noninverting topologies (i.e., boost and SEPIC regulators) and 3mV (typical) for inverting topologies (see the Electrical Characteristics).

## Power Switch Duty Cycle

In order to maintain loop stability and deliver adequate current to the load, the power NPN (Q1 in the Block Diagram) cannot remain "on" for $100 \%$ of each clock cycle. The maximum allowable duty cycle is given by:

$$
D C_{\text {MAX }}=\frac{\left(T_{p}-\text { Min Off Time }\right)}{T_{P}} \cdot 100 \%
$$

where $T_{p}$ is the clock period and Min Off Time (found in the Electrical Characteristics) is typically 100 ns.
The application should be designed so that the operating duty cycle does not exceed $\mathrm{DC}_{\text {max. }}$
The minimum allowable duty cycle is given by:

$$
D C_{\text {MIN }}=\frac{\text { Min On Time }}{T_{P}} \cdot 100 \%
$$

where $T_{p}$ is the clock period and Minimum On Time is as shown in the Typical Performance Characteristics.

The application should be designed so that the operating duty cycle is at least $\mathrm{DC}_{\text {MIN }}$.
Duty cycle equations for several common topologies are given below, where $V_{D}$ is the diode forward voltage drop and $\mathrm{V}_{\text {CESAT }}$ is typically 400 mV at 0.75 A .

For the boost topology:

$$
D C \cong \frac{V_{\text {OUT }}-V_{\text {IN }}+V_{D}}{V_{\text {OUT }}+V_{D}-V_{\text {CESAT }}}
$$

For the SEPIC or dual inductor inverting topology (see Figure 1 and Figure 2):

$$
D C \cong \frac{V_{D}+\left|V_{\text {OUT }}\right|}{V_{I N}+\left|V_{\text {OUT }}\right|+V_{D}-V_{\text {CESAT }}}
$$

The LT8580 can be used in configurations where the duty cycle is higher than $\mathrm{DC}_{\text {MAX }}$, but it must be operated in the discontinuous conduction mode so that the effective duty cycle is reduced.

## Inductor Selection

General Guidelines: The high frequency operation of the LT8580 allows for the use of small surface mount inductors. For high efficiency, choose inductors with high frequency core material, such as ferrite, to reduce core losses. To improve efficiency, choose inductors with more volume for a given inductance. The inductor should have low DCR (copper wire resistance) to reduce $I^{2} \mathrm{R}$ losses, and must be able to handle the peak inductor current without saturating. Note that in some applications, the current handling requirements of the inductor can be lower, such as in the SEPIC topology, where each inductor only carries a fraction of the total switch current. Multilayer or chip inductors usually do not have enough core area to support peak inductor currents in the 1 A to 2 A range. To minimize radiated noise, use a toroidal or shielded inductor. Note that the inductance of shielded types will drop more as current increases, and will saturate more easily. See Table 1 for a list of inductor manufacturers. Thorough lab evaluation is recommended to verify that the following guidelines properly suit the final application.
Table 1. Inductor Manufacturers

| Coilcraft | XAL5050, MSD7342, MSS7341 and <br> LPS4018 Series | www.coilcraft.com |

Minimum Inductance: Although there can be a trade-off with efficiency, it is often desirable to minimize board space by choosing smaller inductors. When choosing

## APPLICATIONS INFORMATION

an inductor, there are two conditions that limit the minimum inductance: (1) providing adequate load current, and (2) avoiding subharmonic oscillation. Choose an inductance that is high enough to meet both of these requirements.

Adequate Load Current: Small value inductors result in increased ripple currents and thus, due to the limited peak switch current, decrease the average current that can be provided to a load (lout). In order to provide adequate load current, L should be at least:

for boost, topologies, or:

$$
\mathrm{L}_{\text {DUAL }}>\frac{\mathrm{DC} \cdot \mathrm{~V}_{\text {IN }}}{2(\mathrm{f})\left(\mathrm{I}_{\mathrm{LIM}}-\frac{\left|\mathrm{V}_{\text {OUT }}\right| \cdot I_{\text {OUT }}}{\mathrm{V}_{\text {IN }} \cdot \eta}-\mathrm{I}_{\text {OUT }}\right)}
$$

for the SEPIC and inverting topologies.
where:
$\mathrm{L}_{\text {BOOST }}=\mathrm{L} 1$ for boost topologies (see Figure 15)
$\mathrm{L}_{\text {DUAL }}=\mathrm{L} 1=\mathrm{L} 2$ for coupled dual inductor topologies
(see Figure 16 and Figure 17)
$L_{\text {DUAL }}=\mathrm{L} 1| | \mathrm{L} 2$ for uncoupled dual inductor topologies
(see Figure 16 and Figure 17)
DC = switch duty cycle (see previous section)
$\mathrm{l}_{\text {LIM }}=$ switch current limit, typically about 1.2 A at $50 \%$ duty cycle (see the Typical Performance Characteristics section).
$\eta=$ power conversion efficiency (typically 85\% for boost and $83 \%$ for dual inductor topologies at high currents).
$f=$ switching frequency
IOUT = maximum load current
Negative values of $L$ indicate that the output load current lout exceeds the switch current limit capability of the LT8580.

Avoiding Subharmonic Oscillations: The LT8580's internal slope compensation circuit can prevent subharmonic oscillations that can occur when the duty cycle is greater than $50 \%$, provided that the inductance exceeds a minimum value. In applications that operate with duty cycles greater than $50 \%$, the inductance must be at least:
$\mathrm{L}_{\text {MIN }}>\frac{\mathrm{V}_{\text {IN }}}{1.25 \cdot(\mathrm{DC}-300 \mathrm{~ns} \cdot \mathrm{f}) \cdot \mathrm{f}} \cdot \frac{2 \cdot \mathrm{DC}-1}{1-\mathrm{DC}}$
$\mathrm{L}_{\text {MIN }}=\mathrm{L} 1$ for boost topologies (see Figure 15)
$\mathrm{L}_{\text {MIN }}=\mathrm{L} 1=\mathrm{L} 2$ for coupled dual inductor topologies (see Figure 16 and Figure 17)
$L_{\text {MIN }}=$ L1||L2 for uncoupled dual inductor topologies (see Figure 16 and Figure 17)
Maximum Inductance: Excessive inductance can reduce current ripple to levels that are difficult for the current comparator (A3 in the Block Diagram) to cleanly discriminate, thus causing duty cycle jitter and/or poor regulation. The maximum inductance can be calculated by:

$$
L_{\text {MAX }}=\frac{V_{\text {IN }}-V_{\text {CESAT }}}{I_{\text {MIN-RIPPLE }}} \cdot \frac{D C}{f}
$$

where
$\mathrm{L}_{\text {MIN }}=\mathrm{L} 1$ for boost topologies (see Figure 15)
$\mathrm{L}_{\mathrm{MIN}}=\mathrm{L} 1=\mathrm{L} 2$ for coupled dual inductor topologies (see Figure 16 and Figure 17)
$L_{\text {MIN }}=\mathrm{L} 1| | \mathrm{L} 2$ for uncoupled dual inductor topologies (see Figure 16 and Figure 17)
$I_{\text {MIN(RIPPLE) }}=$ typically 80 mA
Current Rating: Finally, the inductor(s) must have a rating greater than its peak operating current to prevent inductor saturation resulting in efficiency loss. In steady state, the peak input inductor current (continuous conduction mode only) is given by:

$$
I_{\text {L1-PEAK }}=\frac{\left|V_{O U T} \cdot I_{O U T}\right|}{V_{I N} \bullet \eta}+\frac{V_{I N} \bullet D C}{2 \cdot L 1 \bullet f}
$$

forthe boost, SEPIC and dual inductor inverting topologies.

## APPLICATIONS INFORMATION

For dual dual inductortopologies, the peakoutput inductor current is given by:

$$
\mathrm{I}_{\mathrm{L2}-\mathrm{PEAK}}=\mathrm{I}_{\mathrm{OUT}}+\frac{\left|\mathrm{V}_{\mathrm{OUT}}\right| \cdot(1-\mathrm{DC})}{2 \cdot \mathrm{~L} 2 \cdot f}
$$

For the dual inductor topologies, the total peak current is:

$$
I_{\text {L-PEAK }}=I_{O U T}\left[1+\frac{V_{O U T}}{\eta \bullet V_{I N}}\right]+\frac{V_{I N} \bullet D C}{2 \bullet L \bullet f}
$$

Note: Peak inductor current is limited by the switch current limit. Refer to the Electrical Characteristics table and to the Switch Current Limit vs Duty Cycle plot in the Typical Performance Characteristics.

## Capacitor Selection

Low ESR (equivalent series resistance) capacitors should be used at the outputto minimize the output ripple voltage. Multilayer ceramic capacitors are an excellent choice, as they have an extremely low ESR and are available in very small packages. X5R or X7R dielectrics are preferred, as these materials retain their capacitance over wider voltage and temperature ranges. A $0.47 \mu \mathrm{Fto} 10 \mu \mathrm{~F}$ output capacitor is sufficient for most applications. Always use a capacitor with a sufficient voltage rating. Many ceramic capacitors, particularly 0805 or 0603 case sizes, have greatly reduced capacitance at the desired output voltage. Solid tantalum or OS-CON capacitors can be used, but they will occupy more board area than a ceramic and will have a higher ESR with greater output ripple.
Ceramic capacitors also make a good choice for the input decoupling capacitor, which should be placed as closely as possible to the $\mathrm{V}_{\text {IN }}$ pin of the LT8580 as well as to the inductor connected to the input of the power path. If it is not possible to optimally place a single input capacitor, then use one at the $\mathrm{V}_{\text {IN }}$ pin of the chip ( $\mathrm{C}_{\mathrm{VIN}}$ ) and one at the input of the power path (CPWR). See equations in Table 4, Table 5 and Table 6 for sizing information. A $1 \mu \mathrm{~F}$ to $2.2 \mu$ F input capacitor is sufficient for most applications.

Table 2 shows a list of several ceramic capacitor manufacturers. Consult the manufacturers for detailed information on their entire selection of ceramic parts.

## Compensation—Adjustment

To compensate the feedback loop of the LT8580, a series resistor-capacitor network in parallel with a single capacitor should be connected from the VC pin to GND. For most applications, the series capacitor should be in the range of 470 pF to 2.2 nF with 1 nF being a good starting value. The parallel capacitor should range in value from 10 pF to 100 pF with 47 pF a good starting value. The compensation resistor, $R_{C}$, is usually in the range of 5 k to 50 k . A good technique to compensate a new application is to use a $100 \mathrm{k} \Omega$ potentiometer in place of series resistor $\mathrm{R}_{\mathrm{C}}$. With the series capacitor and parallel capacitor at 1 nF and 47 pF respectively, adjust the potentiometer while observing the transient response and the optimum value for $\mathrm{R}_{\mathrm{C}}$ can be found. Figure 3 ( 3 a to 3 c ) illustrates this process for the circuit of Figure 4 with a load current stepped between 60 mA and 160 mA . Figure 3a shows the transient response with $\mathrm{R}_{\mathrm{C}}$ equal to 2 k . The phase margin is poor, as evidenced by the excessive ringing in the output voltage and inductor current. In Figure 3b, the value of $R_{C}$ is increased to $3 k$, which results in a more damped response. Figure 3c shows the results when $\mathrm{R}_{\mathrm{C}}$ is increased further to 6.04 k . The transient response is nicely damped and the compensation procedure is complete.

## Compensation-Theory

Like all other current mode switching regulators, the LT8580 needs to be compensated for stable and efficient operation. Two feedback loops are used in the LT8580a fast current loop which does not require compensation, and a slower voltage loop which does. Standard bode plot analysis can be used to understand and adjust the voltage feedback loop.

## LT8580

## APPLICATIONS INFORMATION

(3a) Transient Response Shows Excessive Ringing

(3b) Transient Response Is Better

(3c) Transient Response Is Well Damped

Figure 3. Transient Response

Figure 4. 1.5MHz, 5V to 12V Boost Converter

## APPLICATIONS INFORMATION

As with any feedback loop, identifying the gain and phase contribution of the various elements in the loop is critical. Figure 5 shows the key equivalent elements of a boost converter. Because of the fast current control loop, the power stage of the IC, inductor and diode have been replaced by a combination of the equivalent transconductance amplifier $g_{m p}$ and the current controlled current source which converts $I_{\text {VIN }}$ to $\left(\eta V_{\text {IN }} / V_{\text {OUT }}\right) \cdot I_{\text {VIN. }} g_{\text {mp }}$ acts as a current source where the peak input current, $\mathrm{I}_{\text {VIN }}$, is proportional to the VC voltage. $\eta$ is the efficiency of the switching regulator, and is typically about $85 \%$.
Note that the maximum output currents of $g_{m p}$ and $g_{m a}$ are finite. The limits for $g_{m p}$ are in the Electrical Characteristics section (switch current limit), and $\mathrm{gma}_{\text {ma }}$ is nominally limited to about $+15 \mu \mathrm{~A}$ and $-17 \mu \mathrm{~A}$.

CC: COMPENSATION CAPACITOR
Cout: OUTPUT CAPACITOR
CpL: PHASE LEAD CAPACITOR
$\mathrm{C}_{\mathrm{F}}$ : HIGH FREQUENCY FILTER CAPACITOR
$g_{m a}$ : TRANSCONDUCTANCE AMPLIFIER INSIDE IC
$g_{m p}$ : POWER STAGE TRANSCONDUCTANCE AMPLIFIER
Rc: COMPENSATION RESISTOR
$R_{L}$ : OUTPUT RESISTANCE DEFINED AS V VUT DIVIDED BY I LOAD(MAX)
Ro: OUTPUT RESISTANCE OF $\mathrm{gma}_{\mathrm{ma}}$
R1, R2: FEEDBACK RESISTOR DIVIDER NETWORK
RESR: OUTPUT CAPACITOR ESR
$\eta$ : CONVERTER EFFICIENCY ( $\sim 85 \%$ AT HIGHER CURRENTS)
Figure 5. Boost Converter Equivalent Model

From Figure 5, the DC gain, poles and zeros can be calculated as follows:

Output Pole: $\quad P 1=\frac{2}{2 \cdot \pi \cdot R_{L} \cdot C_{\text {OUT }}}$
Error Amp Pole: $\quad \mathrm{P} 2=\frac{1}{2 \cdot \pi \cdot\left[\mathrm{R}_{\mathrm{O}}+\mathrm{R}_{\mathrm{C}}\right] \cdot \mathrm{C}_{\mathrm{C}}}$
Error Amp Zero: $\quad Z 1=\frac{1}{2 \bullet \pi \bullet R_{C} \bullet \mathrm{C}_{C}}$
DC Gain:
(Breaking Loop at FBX Pin)
$A_{D C}=A_{O L}(0)=\frac{\partial V_{C}}{\partial V_{F B X}} \cdot \frac{\partial I_{V I N}}{\partial V_{C}} \cdot \frac{\partial V_{O U T}}{\partial I_{V I N}} \cdot \frac{\partial V_{F B X}}{\partial V_{O U T}}=$
$\left(g_{m a} \cdot R_{0}\right) \bullet g_{m p} \bullet\left(\eta \cdot \frac{V_{I N}}{V_{O U T}} \cdot \frac{R_{L}}{2}\right) \cdot \frac{0.5 R 2}{R 1+0.5 R 2}$
ESR Zero: $\quad Z 2=\frac{1}{2 \cdot \pi \cdot R_{E S R} \cdot \mathrm{C}_{\text {OUT }}}$
RHP Zero: $\quad Z 3=\frac{V_{\text {IN }}{ }^{2} \cdot R_{L}}{4 \cdot \pi \cdot V_{\text {OUT }}{ }^{2} \cdot L}$
High Frequency Pole: P3> $\frac{\mathrm{f}_{\mathrm{s}}}{3}$
Phase Lead Zero: $\quad Z 4=\frac{1}{2 \cdot \pi \cdot R 1 \cdot C_{P L}}$
Phase Lead Pole: $P 4=\frac{1}{2 \cdot \pi \cdot \frac{R 1 \cdot \frac{R 2}{2}}{R 1+\frac{R 2}{2}} \cdot C_{P L}}$
Error Amp Filter Pole:

$$
\text { P5 }=\frac{1}{2 \cdot \pi \cdot \frac{R_{C} \cdot R_{0}}{R_{C}+R_{0}} \cdot C_{F}}, C_{F}<\frac{C_{C}}{10}
$$

The current mode zero ( Z 3 ) is a right-half plane zero which can be an issue in feedback control design, but is manageable with proper external component selection.

## APPLICATIONS INFORMATION

Using the circuit in Figure 4 as an example, Table 3 shows the parameters used to generate the bode plot shown in Figure 6.

Figure 6. Bode Plot for Example Boost Converter

Table 3. Bode Plot Parameters

| PARAMETER | VALUE | UNITS | COMMENT |
| :--- | :---: | :---: | :---: |
| $\mathrm{R}_{\mathrm{L}}$ | 60 | $\Omega$ | Application Specific |
| $\mathrm{C}_{\text {OUT }}$ | 4.7 | $\mu \mathrm{~F}$ | Application Specific |
| $\mathrm{R}_{\text {ESR }}$ | 10 | $\mathrm{~m} \Omega$ | Application Specific |
| $\mathrm{R}_{0}$ | 300 | $\mathrm{k} \Omega$ | Not Adjustable |
| $\mathrm{C}_{\mathrm{C}}$ | 3300 | pF | Adjustable |
| $\mathrm{C}_{\mathrm{F}}$ | 47 | pF | Optional/Adjustable |
| $\mathrm{C}_{\mathrm{PL}}$ | 0 | pF | Optional/Adjustable |
| $\mathrm{R}_{\mathrm{C}}$ | 6.04 | $\mathrm{k} \Omega$ | Adjustable |
| R 1 | 130 | $\mathrm{k} \Omega$ | Adjustable |
| $\mathrm{R}^{2}$ | 14.6 | $\mathrm{k} \Omega$ | Not Adjustable |
| $\mathrm{V}_{\text {OUT }}$ | 12 | V | Application Specific |
| $\mathrm{V}_{\text {IN }}$ | 5 | V | Application Specific |
| $\mathrm{g}_{\mathrm{ma}}$ | 200 | $\mu \mathrm{mho}$ | Not Adjustable |
| $\mathrm{g}_{\mathrm{mp}}$ | 7 | mho | Not Adjustable |
| L | 15 | $\mu \mathrm{H}$ | Application Specific |
| $\mathrm{f}_{\mathrm{S}}$ | 1.5 | MHz | Adjustable |

In Figure 6, the phase is $-126^{\circ}$ when the gain reaches 0dB giving a phase margin of $54^{\circ}$. The crossover frequency is 14 kHz , which is more than three times lower than the frequency of the RHP zero to achieve adequate phase margin.

## Diode Selection

Schottky diodes, with their low forward-voltage drops and fast switching speeds, are recommended for use with the LT8580. For applications where $\mathrm{V}_{\mathrm{R}}$ (see Tables 4, 5 and $6)<40 \mathrm{~V}$, the Diodes, Inc. SBR1V40LP is a good choice. Where $V_{R}>40 \mathrm{~V}$, the Diodes Inc. DFLS1100 works well. These diodes are rated to handle an average forward current of 1 A .

## Oscillator

The operating frequency of the LT8580 can be set by the internal free-running oscillator. When the SYNC pin is driven low ( $<0.4 \mathrm{~V}$ ), the frequency of operation is set by a resistor from $\mathrm{R}_{\top}$ to ground. An internally trimmed timing capacitor resides inside the IC. The oscillator frequency is calculated using the following formula:

$$
\mathrm{f}_{\mathrm{OSC}}=\frac{85.5}{\left(\mathrm{R}_{\mathrm{T}}+1\right)}
$$

where $f_{0 S c}$ is in $M H z$ and $R_{T}$ is in $k \Omega$. Conversely, $R_{T}$ (in $k \Omega$ ) can be calculated from the desired frequency (in MHz) using:

$$
\mathrm{R}_{\mathrm{T}}=\frac{85.5}{\mathrm{f}_{\mathrm{OSC}}}-1
$$

## Clock Synchronization

The operating frequency of the LT8580 can be synchronized to an external clock source. To synchronize to the external source, simply provide a digital clock signal into the SYNC pin. The LT8580 will operate at the SYNC clock frequency. The LT8580 will revert to the internal free-running oscillator clock after SYNC is driven low for a few free-running clock periods.

## APPLICATIONS INFORMATION

Driving SYNC high for an extended period of time effectively stops the operating clock and prevents latch SR1 from becoming set (see the Block Diagram). As a result, the switching operation of the LT8580 will stop.

The duty cycle of the SYNC signal must be between $35 \%$ and $65 \%$ for proper operation. Also, the frequency of the SYNC signal must meet the following two criteria:
(1) SYNC may not toggle outside the frequency range of 200 kHz to 1.5 MHz unless it is stopped low to enable the free-running oscillator.
(2) The SYNC frequency can always be higher than the free-running oscillator frequency, $\mathrm{f}_{\mathrm{OSc}}$, but should not be less than $25 \%$ below fosc.

## Operating Frequency Selection

There are several considerations in selecting the operating frequency of the converter. The first is staying clear of sensitive frequency bands, which cannot tolerate any spectral noise. For example, in products incorporating RF communications, the 455 kHz IF frequency is sensitive to any noise, therefore switching above 600 kHz is desired. Some communications have sensitivity to 1.1 MHz , and in that case, a 1.5MHz switching converter frequency may be employed. The second consideration is the physical size of the converter. As the operating frequency goes up, the inductor and filter capacitors go down in value and size. The trade-off is efficiency, since the switching losses due to NPN base charge (see Thermal Calculations), Schottky diode charge, and other capacitive loss terms increase proportionally with frequency.

## Soft-Start

The LT8580 contains a soft-start circuit to limit peak switch currents during start-up. High start-up current is inherent in switching regulators in general since the feedback loop is saturated due to $\mathrm{V}_{\text {OUT }}$ being far from its final value. The regulator tries to charge the output capacitor as quickly as possible, which results in large peak currents.
The start-up current can be limited by connecting an external capacitor (typically 100 nF to $1 \mu \mathrm{~F}$ ) to the SS pin.

This capacitor is slowly charged to $\sim 2.1 \mathrm{~V}$ by an internal 280 k resistor once the part is activated. SS pin voltages below $\sim 1.1 \mathrm{~V}$ reduce the internal current limit. Thus, the gradual ramping of the SS voltage also gradually increases the current limit as the capacitor charges. This, in turn, allows the output capacitor to charge gradually toward its final value while limiting the start-up current.
In the event of a commanded shutdown or lockout ( $\overline{\mathrm{SHDN}}$ pin), internal undervoltage lockout (UVLO) or a thermal lockout, the soft-start capacitor is automatically discharged to $\sim 200 \mathrm{mV}$ before charging resumes, thus assuring that the soft-start occurs after every reactivation of the chip.

## Shutdown

The $\overline{\text { SHDN }}$ pin is used to enable or disable the chip. For most applications, $\overline{\text { SHDN }}$ can be driven by a digital logic source. Voltages above 1.4 V enable normal active operation. Voltages below 300 mV will shutdown the chip, resulting in extremely low quiescent current.
While the $\overline{\text { SHDN }}$ voltage transitions through the lockout voltage range ( 0.3 V to 1.21 V ) the power switch is disabled and the SR2 latch is set (see the Block Diagram). This causes the soft-start capacitor to begin discharging, which continues until the capacitor is discharged and active operation is enabled. Although the power switch is disabled, SHDN voltages in the lockout range do not necessarily reduce quiescent current until the SHDN voltage is near or below the shutdown threshold.

Also note that $\overline{\text { SHDN }}$ can be driven above $\mathrm{V}_{\text {IN }}$ or $\mathrm{V}_{\text {OUT }}$ as long as the SHDN voltage is limited to less than 40 V .

Figure 7. Chip States vs SHDN Voltage

## APPLICATIONS INFORMATION

## Configurable Undervoltage Lockout

Figure 8 shows how to configure an undervoltage lockout (UVLO) for the LT8580. Typically, UVLO is used in situations where the input supply is current-limited, has a relatively high source resistance, or ramps up/down slowly. A switching regulator draws constant power from the source, so source current increases as source voltage drops. This looks like a negative resistance load to the source and can cause the source to current-limit or latch low under low source voltage conditions. UVLO prevents the regulator from operating at source voltages where these problems might occur.

The shutdown pin comparator has voltage hysteresis with typical thresholds of 1.31 V (rising) and 1.27 V (falling). Resistor R ${ }_{\text {UVLO2 }}$ is optional. R ${ }_{\text {UVLO2 }}$ can be included to reduce the overall UVLO voltage variation caused by variations in SHDN pin current (see the Electrical Characteristics). A good choice for RUVLO2 is $\leq 10 \mathrm{k} \pm 1 \%$. After choosing a value for RUVL02, RUVL01 can be determined from either of the following:

$$
\mathrm{R}_{\mathrm{UVLO} 1}=\frac{\mathrm{V}_{\mathrm{IN}}+-1.31 \mathrm{~V}}{\left(\frac{1.31 \mathrm{~V}}{\mathrm{R}_{\mathrm{UVLO2}}}\right)+12 \mu \mathrm{~A}}
$$

or
$R_{\text {UVL01 }}=\frac{V_{\text {IN }}-1.27 \mathrm{~V}}{\left(\frac{1.27 \mathrm{~V}}{R_{\text {UVL02 }}}\right)+12 \mu \mathrm{~A}}$
where $\mathrm{V}_{\text {IN }}{ }^{+}$and $\mathrm{V}_{\text {IN }}{ }^{-}$are the $\mathrm{V}_{\text {IN }}$ voltages when rising or falling, respectively.

For example, to disable the LT8580 for $\mathrm{V}_{\text {IN }}$ voltages below 3.5 V using the single resistor configuration, choose:

$$
R_{\text {UVL01 }}=\frac{3.5 \mathrm{~V}-1.27 \mathrm{~V}}{\left(\frac{1.27 \mathrm{~V}}{\infty}\right)+12 \mu \mathrm{~A}}=187 \mathrm{k}
$$

To activate the LT8580 for $\mathrm{V}_{\text {IN }}$ voltages greater than 4.5 V using the double resistor configuration, choose $R_{\text {UVLO2 }}=10 \mathrm{k}$ and:

$$
R_{U V L 01}=\frac{4.5 \mathrm{~V}-1.31 \mathrm{~V}}{\left(\frac{1.31 \mathrm{~V}}{10 \mathrm{k}}\right)+12 \mu \mathrm{~A}}=22.1 \mathrm{k}
$$

## Internal Undervoltage Lockout

The LT8580 monitors the $\mathrm{V}_{\text {IN }}$ supply voltage in case $\mathrm{V}_{\text {IN }}$ drops below a minimum operating level (typically about 2.35 V ). When $\mathrm{V}_{\mathrm{IN}}$ is detected low, the power switch is deactivated, and while sufficient $V_{\text {IN }}$ voltage persists, the soft-start capacitor is discharged. After $\mathrm{V}_{\text {IN }}$ is detected high, the power switch will be reactivated and the softstart capacitor will begin charging.

## Thermal Considerations

For the LT8580 to deliver its full output power, it is imperative that a good thermal path be provided to dissipate the heat generated within the package. This is accomplished by taking advantage of the thermal pad on the underside of the IC. It is recommended that multiple vias in the printed circuit board be used to conduct heat away from the IC and into a copper plane with as much area as possible.

Figure 8. Configurable UVLO

## APPLICATIONS INFORMATION

## Thermal Lockout

If the die temperature reaches approximately $165^{\circ} \mathrm{C}$, the part will go into thermal lockout, the power switch will be turned off and the soft-start capacitor will be discharged. The part will be enabled again when the die temperature has dropped by $\sim 5^{\circ} \mathrm{C}$ (nominal).

## Thermal Calculations

Power dissipation in the LT8580 chip comes from four primary sources: switch $I^{2} R$ loss, NPN base drive (AC), NPN base drive (DC), and additional input current. The following formulas can be used to approximate the power losses. These formulas assume continuous mode operation, so they should not be used for calculating efficiency in discontinuous mode or at light load currents.

$$
\begin{aligned}
& \text { Average Input Current: } \quad I_{I N}=\frac{V_{O U T} \bullet I_{O U T}}{V_{I N} \bullet \eta} \\
& \text { Switch Conduction Loss: } \quad P_{S W}=(D C)\left(I_{I N}\right)\left(V_{S W}\right) \\
& \text { Base Drive Loss }(A C): \quad P_{B A C}=20 n s\left(I_{\text {IN }}\right)\left(V_{O U T}\right)(f) \\
& \text { Base Drive Loss (DC): } \quad P_{B D C}=\frac{\left(V_{I N}\right)\left(I_{\text {IN }}\right)(D C)}{40} \\
& \text { Input Power Loss: } \quad P_{I N P}=6 m A\left(V_{\mathbb{I N}}\right)
\end{aligned}
$$

where:
$V_{\text {SW }}=$ switch on voltage (see Typical Performance Characteristics for Switch Saturation Voltage)

DC = duty cycle (see the Power Switch Duty Cycle section for formulas)
$\eta$ = power conversion efficiency (typically $85 \%$ at high currents)
Example: boost configuration, $\mathrm{V}_{\text {IN }}=5 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=12 \mathrm{~V}$, $\mathrm{I}_{\text {OUT }}=0.2 \mathrm{~A}, \mathrm{f}=1.25 \mathrm{MHz}, \mathrm{V}_{\mathrm{D}}=0.5 \mathrm{~V}$ :
$I_{I N}=0.56 \mathrm{~A}$
$D C=62.0 \%$

$$
\begin{aligned}
& P_{\text {SW }}=117 \mathrm{~mW} \\
& \mathrm{P}_{\mathrm{BAC}}=169 \mathrm{~mW} \\
& \mathrm{P}_{\mathrm{BDC}}=44 \mathrm{~mW} \\
& \mathrm{P}_{\text {INP }}=30 \mathrm{~mW} \\
& \text { Total LT8580 power dissipation }\left(\mathrm{P}_{\mathrm{TOT}}\right)=361 \mathrm{~mW}
\end{aligned}
$$

Thermal resistance for the LT8580 is influenced by the presence of internal, topside or backside planes. To calculate die temperature, use the appropriate thermal resistance number and add in worst-case ambient temperature:

$$
\mathrm{T}_{\mathrm{J}}=\mathrm{T}_{\mathrm{A}}+\theta_{\mathrm{JA}} \cdot \mathrm{P}_{\mathrm{TOT}}
$$

where $T_{J}=$ junctiontemperature, $T_{A}=$ ambienttemperature, and $\theta_{\mathrm{JA}}$ is the thermal resistance from the silicon junction to the ambient air.

The published $\theta_{\mathrm{JA}}$ value is $43^{\circ} \mathrm{C} / \mathrm{W}$ for the $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN package and $35^{\circ} \mathrm{C} / \mathrm{W}$ to $40^{\circ} \mathrm{C} / \mathrm{W}$ for the MSOP exposed pad package. In practice, lower $\theta_{\mathrm{JA}}$ values can be obtained if the board layout uses ground as a heat sink. For instance, thermal resistances of $34.7^{\circ} \mathrm{C} / \mathrm{W}$ for the DFN package and $22.5^{\circ} \mathrm{C} / \mathrm{W}$ for the MSOP package were obtained on a board designed with large ground planes.

## $V_{\text {IN }}$ Ramp Rate

While initially powering a switching converter application, the $\mathrm{V}_{\text {IN }}$ ramp rate should be limited. High $\mathrm{V}_{\text {IN }}$ ramp rates can cause excessive inrush currents in the passive components of the converter. This can lead to current and/or voltage overstress and may damage the passive components or the chip. Ramp rates less than $500 \mathrm{mV} / \mu \mathrm{s}$, depending on component parameters, will generally prevent these issues. Also, be carefulto avoid hot-plugging. Hot-plugging occurs when an active voltage supply is "instantly" connected or switched to the input of the converter. Hot-plugging results in very fast input ramp rates and is not recommended. Finally, for more information, refer to Linear application note AN88, which discusses voltage overstress that can occur when an inductive source impedance is hot-plugged to an input pin bypassed by ceramic capacitors.

## APPLICATIONS INFORMATION

## Layout Hints

As with all high frequency switchers, when considering layout, care must be taken to achieve optimal electrical, thermal and noise performance. One will not get advertised performance with a careless layout. For maximum efficiency, switch rise and fall times are typically in the 10 ns to 20 ns range. To prevent noise, both radiated and conducted, the high speed switching current path, shown in Figure 9, must be kept as short as possible. This is implemented in the suggested layout of a boost configuration in Figure 10. Shortening this path will also reduce the parasitic trace inductance. At switch-off, this parasitic inductance produces a flyback spike across the LT8580 switch. When operating at higher currents and output voltages, with poor layout, this spike can generate voltages across the LT8580 that may exceed its absolute maximum rating. A ground plane should also be used under the switcher circuitry to prevent interplane coupling and overall noise.
The VC and FBX components should be kept as far away as practical from the switch node. The ground for these components should be separated from the switch current path. Failure to do so can result in poor stability or subharmonic oscillation.

Board layout also has a significant effect on thermal resistance. The exposed package ground pad is the copper plate that runs under the LT8580 die. This is a good thermal path for heat out of the package. Soldering the pad onto

the board reduces die temperature and increases the power capability of the LT8580. Provide as much copper area as possible around this pad. Adding multiple feedthroughs around the pad to the ground plane will also help. Figure 10 and Figure 11 show the recommended component placement for the boost and SEPIC configurations, respectively.

## Layout Hints for Inverting Topology

Figure 12 shows recommended component placement for the dual inductor inverting topology. Input bypass capacitor, C1, should be placed close to the LT8580, as shown. The load should connect directly to the output capacitor, C2, for best load regulation. The local ground may be tied into the system ground plane at the C3 ground terminal.
The cut ground copper at D1's cathode is essential to obtain low noise. This important layout issue arises due to the chopped nature of the currents flowing in Q1 and D1. If they are both tied directly to the ground plane before being combined, switching noise will be introduced into the ground plane. It is almost impossible to get rid of this noise, once present in the ground plane. The solution is to tie D1's cathode to the ground pin of the LT8580 before the combined currents are dumped in the ground plane as drawn in Figure 2, Figure 13 and Figure 14. This single layout technique can virtually eliminate high frequency "spike" noise, so often present on switching regulator outputs.

## DIFFERENCES FROM LT3580

LT8580 is very similar to LT3580. However, LT8580 does deviate from LT3580 in a few areas:

- $65 \mathrm{~V}, 1 \mathrm{~A}$ switch
- $40 \mathrm{~V} \mathrm{~V}_{\text {IN }}$ and $\overline{\text { SHDN }}$ absolute maximum rating
- FB renamed to FBX
- 5V FBX absolute maximum rating

## APPLICATIONS InFORMATION

BOOST CONVERTER COMPONENT SELECTION

Figure 15. Boost Converter: The Component Values and Voltages Given Are Typical Values for a $1.5 \mathrm{MHz}, 5 \mathrm{~V}$ to 12 V Boost

The LT8580 can be configured as a boost converter as in Figure 15. This topology allows for positive output voltages that are higher than the input voltage. A single feedback resistor sets the output voltage. For output voltages higher than 60V, see the Charge Pump Aided Regulators section.

Table 4 is a step-by-step set of equations to calculate component values for the LT8580 when operating as a boost converter. Input parameters are input and output voltage, and switching frequency ( $\mathrm{V}_{\text {IN }}, \mathrm{V}_{\text {OUT }}$ and $\mathrm{f}_{\text {osc }}$ respectively). Refer to the Applications Information section for further information on the design equations presented in Table 4.

## Variable Definitions:

$\mathrm{V}_{\text {IN }}=$ Input Voltage
$V_{\text {OUT }}=$ Output Voltage
DC = Power Switch Duty Cycle
$f_{0 S C}=$ Switching Frequency
$I_{\text {OUT }}=$ Maximum Average Output Current
$I_{\text {RIPPLE }}=$ Inductor Ripple Current

Table 4. Boost Design Equations

|  | PARAMETERS/EQUATIONS |
| :---: | :---: |
| Step 1: Inputs | Pick $\mathrm{V}_{\text {IN }}, \mathrm{V}_{\text {OUT }}$, and $\mathrm{f}_{\text {osc }}$ to calculate equations below |
| Step 2: DC | $\begin{aligned} & D C_{\text {MAX }}=\frac{V_{\text {OUT }}-V_{\text {IN(MIN })}+0.5 \mathrm{~V}}{V_{\text {OUT }}+0.5 \mathrm{~V}-0.4 \mathrm{~V}} \\ & D C_{\text {MIN }}=\frac{V_{\text {OUT }}-V_{\text {IN(MAX })}+0.5 \mathrm{~V}}{V_{\text {OUT }}+0.5 \mathrm{~V}-0.4 \mathrm{~V}} \end{aligned}$ |
| Step 3: L1 | - Solve equations 1 to 4 for a range of $L$ values <br> - The minimum of the $L$ value range is the higher of $L_{T Y P}$ and $L_{\text {MIN }}$ <br> - The maximum of the $L$ value range is the lower of $L_{\text {MAX1 }}$ and $L_{\text {MAX2 }}$. |
| Step 4: <br> IRIPPLE | $\begin{aligned} & \mathrm{I}_{\text {RIPPLE(MIN })}=\frac{\left(\mathrm{V}_{\text {IN(MIN })}-0.4 \mathrm{~V}\right) \cdot D \mathrm{C}_{\text {MAX }}}{\mathrm{f}_{0 S C} \cdot \mathrm{~L}_{1}} \\ & \mathrm{I}_{\text {RIPPLE(MAX })}=\frac{\left(\mathrm{V}_{\text {IN(MAX })}-0.4 \mathrm{~V}\right) \cdot \mathrm{DC} C_{\text {MIN }}}{\mathrm{f}_{\mathrm{OSC}} \cdot \mathrm{~L}_{1}} \end{aligned}$ |
| Step 5: IOUT | $\begin{aligned} & I_{\text {OUT(MIN })}=\left(1 A-\frac{I_{\text {RIPPLE(MIN })}}{2}\right) \cdot\left(1-D C_{\text {MAX }}\right) \\ & I_{\text {OUT(MAX) }}=\left(1 A-\frac{I_{\text {RIPPLE(MAX) }}}{2}\right) \cdot\left(1-D C_{\text {MIN }}\right) \end{aligned}$ |
| Step 6: D1 | $\mathrm{V}_{\mathrm{R}}>\mathrm{V}_{\text {OUT }} ; \mathrm{I}_{\text {AVG }}>\mathrm{I}_{\text {OUT }}$ |

## APPLICATIONS InFORMATION

## SEPIC CONVERTER COMPONENT SELECTION (COUPLED OR UNCOUPLED INDUCTORS)

Figure 16. SEPIC Converter: The Component Values and Voltages Given Are Typical Values for a $1 \mathrm{MHz}, 9 \mathrm{~V}$ to 16 V Input to 12 V Output SEPIC Converter

The LT8580 can also be configured as a SEPIC, as shown in Figure 16. This topology allows for positive output voltages that are lower, equal or higher than the input voltage. Output disconnect is inherently built into the SEPIC topology, meaning no DC path exists between the input and output due to capacitor C1.
Table 5 is a step-by-step set of equations to calculate component values for the LT8580 when operating as a SEPIC converter. Input parameters are input and output voltage, and switching frequency ( $\mathrm{V}_{\text {IN }}, \mathrm{V}_{\text {OUT }}$ and $\mathrm{f}_{\mathrm{OSC}}$, respectively). Refer to the Applications Information section for further information on the design equations presented in Table 5.

## Variable Definitions:

$\mathrm{V}_{\text {IN }}=$ Input Voltage
VOUT $=$ Output Voltage
DC = Power Switch Duty Cycle
$f_{0 S C}=$ Switching Frequency
$I_{\text {OUT }}=$ Maximum Average Output Current
$I_{\text {RIPPLE }}=$ Inductor Ripple Current

Table 5. SEPIC Design Equations

|  | PARAMETERS/EQUATIONS |  |
| :---: | :---: | :---: |
| Step 1: Inputs | Pick $\mathrm{V}_{\text {IN }}, \mathrm{V}_{\text {OUT }}$ and $\mathrm{f}_{\text {Osc }}$ to calculate equations below |  |
| Step 2: DC | $\begin{aligned} & \mathrm{DC} \mathrm{MAX}=\frac{\mathrm{V}_{\text {OUT }}+0.5 \mathrm{~V}}{\mathrm{~V}_{\text {IN(MIN })}+\mathrm{V}_{\text {OUT }}+0.5 \mathrm{~V}-0.4 \mathrm{~V}} \\ & \mathrm{DC} \\ & \text { MIIN }=\frac{\mathrm{V}_{\text {OUT }}+0.5 \mathrm{~V}}{\mathrm{~V}_{\text {IN(MAX })}+\mathrm{V}_{\text {OUT }}+0.5 \mathrm{~V}-0.4 \mathrm{~V}} \end{aligned}$ |  |
| Step 3: L | $\begin{aligned} & \mathrm{L}_{\text {TYP }}=\frac{\left(\mathrm{V}_{\text {IN(MIN })}-0.4 \mathrm{~V}\right) \cdot \mathrm{DC}_{\text {MAX }}}{\mathrm{f}_{\mathrm{OSC}} \cdot 0.3 \mathrm{~A}} \\ & \mathrm{~L}_{\text {MIN }}=\frac{\left(\mathrm{V}_{\text {IN(MIN })}-0.4 \mathrm{~V}\right) \cdot\left(2 \cdot \mathrm{DC}_{\text {MAX }}-1\right)}{1.25 \cdot\left(\mathrm{DC}_{\text {MAX }}-300 \mathrm{NS} \cdot \mathrm{f}_{\mathrm{OSC}}\right) \cdot \mathrm{f}_{\mathrm{OSC}} \cdot\left(1-\mathrm{DC}_{\text {MAX }}\right)} \\ & \mathrm{L}_{\text {MAX }}=\frac{\left(\mathrm{V}_{\text {IN(MIN })}-0.4 \mathrm{~V}\right) \cdot \mathrm{DC}_{\text {MAX }}}{\mathrm{f}_{\mathrm{OSC}} \cdot 0.08 \mathrm{~A}} \end{aligned}$ | (1) (2) (3) |

- Solve equations 1,2 and 3 for a range of $L$ values
- The minimum of the $L$ value range is the higher of $L_{T Y P}$ and $L_{\text {MIN }}$
- The maximum of the $L$ value range is $L_{\text {max }}$
- $\mathrm{L}=\mathrm{L} 1$ = L2 for coupled inductors
- $\mathrm{L}=\mathrm{L} 1| | \mathrm{L} 2$ for uncoupled inductors

| Step 4: |  |
| :--- | :--- |
| $\mathrm{I}_{\text {RIPPLE }}$ | $\mathrm{I}_{\text {RIPPLE(MIN })}=\frac{\left(\mathrm{V}_{\text {IN(MIN })}-0.4 \mathrm{~V}\right) \cdot \mathrm{DC}_{\text {MAX }}}{\mathrm{f}_{\text {OSC }} \cdot \mathrm{L}}$ |

|  | $\mathrm{I}_{\text {RIPPLE(MAX })}=\frac{\left(\mathrm{V}_{\text {IN(MAX })}-0.4 \mathrm{~V}\right) \cdot D \mathrm{C}_{\text {MIN }}}{\mathrm{f}_{\text {OSC }} \cdot \mathrm{L}}$ |
| :--- | :--- |
| Step 5: | $\mathrm{I}_{\text {OUT(MIIN }}=\left(1 \mathrm{~A}-\frac{\mathrm{I}_{\text {RIPPLE(MIN })}}{2}\right) \cdot\left(1-\mathrm{DC}_{\text {MAX }}\right)$ |
| $\mathrm{I}_{\text {OUT }}$ | $\mathrm{I}_{\text {OUT(MAX })}=\left(1 \mathrm{~A}-\frac{\mathrm{I}_{\text {RIPLE(MAX })}}{2}\right) \cdot\left(1-\mathrm{DC}_{\text {MII }}\right)$ |

Step 6: $\quad V_{R}>V_{\text {IN }}+V_{\text {OUT; }} I_{\text {IVG }}>I_{\text {OUT }}$
D1
Step 7: $\quad \mathrm{C} 1 \geq 1 \mu F ; \mathrm{V}_{\text {RATING }} \geq \mathrm{V}_{\mathrm{IN}}$
C1

| Step 8: |  |
| :--- | :--- |
| $C_{\text {OUT }}$ | $C_{\text {OUT }} \geq \frac{l_{\text {OUTTMIN }} \cdot D C_{\text {MAX }}}{f_{\text {OSC }} \cdot 0.005 \cdot V_{\text {OUT }}}$ |

Step 9:
$\mathrm{C}_{\text {IN }}$
$\mathrm{C}_{\text {IN }} \geq \mathrm{C}_{\text {VIN }}+\mathrm{C}_{\text {PWR }} \geq$
$\frac{1 \mathrm{~A} \cdot \mathrm{DC}_{\text {MAX }}}{40 \bullet \mathrm{f}_{\mathrm{OSC}} \cdot 0.005 \cdot \mathrm{~V}_{\text {IN(MIN })}}+\frac{\mathrm{I}_{\text {RIPPLE(MAX })}}{8 \bullet \mathrm{f}_{\mathrm{OSC}} \cdot 0.005 \cdot \mathrm{~V}_{\text {IN(MAX })}}$

- Refer to the Capacitor Selection Section for definition of $\mathrm{C}_{\text {VIN }}$ and $\mathrm{C}_{\text {PWR }}$

Step 10:
$\mathrm{R}_{\mathrm{FBX}}$
Step 11:
$\mathrm{R}_{\mathrm{T}}$
Note 1: This table uses 1A for the peak switch current. Refer to the Electrical Characteristics Table and Typical Performance Characteristics plots for the peak switch current at an operating duty cycle.
Note 2: The final values for $\mathrm{C}_{0 U T}, \mathrm{C}_{\mathrm{IN}}$ and $\mathrm{C}_{1}$ may deviate from the previous equations in order to obtain desired load transient performance.

## APPLICATIONS INFORMATION

## DUAL INDUCTOR INVERTING CONVERTER COMPONENT SELECTION (COUPLED OR UNCOUPLED INDUCTORS)

Figure 17. Dual Inductor Inverting Converter: The Component Values and Voltages Given Are Typical Values for a 750 kHz Wide Input (5V to 40V) to -15V Inverting Topology Using Coupled Inductors
Due to its unique FBX pin, the LT8580 can work in a dual inductor inverting configuration as in Figure 17. Changing the connections of L 2 and the Schottky diode in the SEPIC topology results in generating negative output voltages. This solution results in very low output voltage ripple due to inductor L2 being in series with the output. Output disconnect is inherently built into this topology due to the capacitor C 1 .

Table 6 is a step-by-step set of equations to calculate component values for the LT8580 when operating as a dual inductor inverting converter. Input parameters are input and output voltage, and switching frequency ( $\mathrm{V}_{1 \mathbb{N}}$, $V_{\text {OUt }}$ and $\mathrm{f}_{\text {osc }}$ respectively). Refer to the Applications Information section for further information on the design equations presented in Table 6.

## Variable Definitions:

$\mathrm{V}_{\text {IN }}=$ Input Voltage
$V_{\text {OUT }}=$ Output Voltage
DC = Power Switch Duty Cycle
$\mathrm{f}_{\text {OSc }}=$ Switching Frequency
$I_{\text {OUt }}=$ Maximum Average Output Current
$I_{\text {RIPPLE }}=$ Inductor Ripple Current

Table 6. Dual Inductor Inverting Design Equations

|  | PARAMETERS/EQUATIONS |  |
| :---: | :---: | :---: |
| Step 1: <br> Inputs | Pick $\mathrm{V}_{\text {IN }}, \mathrm{V}_{\text {OUT }}$ and $\mathrm{f}_{\text {Osc }}$ to calculate equations below |  |
| $\begin{aligned} & \text { Step 2: } \\ & \text { DC } \end{aligned}$ | $\begin{aligned} & \mathrm{DC}_{\text {MAX }}=\frac{\left\|\mathrm{V}_{\text {OUT }}\right\|+0.5 \mathrm{~V}}{\mathrm{~V}_{\text {IN(MIN })}+\left\|\mathrm{V}_{\text {OUT }}\right\|+0.5 \mathrm{~V}-0.4 \mathrm{~V}} \\ & \mathrm{DC}_{\text {MIN }}=\frac{\left\|\mathrm{V}_{\text {OUT }}\right\|+0.5 \mathrm{~V}}{\mathrm{~V}_{\text {IIMAX }}+\left\|\mathrm{V}_{\text {OUT }}\right\|+0.5 \mathrm{~V}-0.4 \mathrm{~V}} \end{aligned}$ |  |
| $\begin{aligned} & \text { Step 3: } \\ & \text { L } \end{aligned}$ | $\begin{aligned} & \mathrm{L}_{\text {TYP }}=\frac{\left(\mathrm{V}_{\mathrm{IN}(\mathrm{MIN})}-0.4 \mathrm{~V}\right) \cdot \mathrm{DC}_{\text {MAX }}}{\mathrm{f}_{\mathrm{OSC}} \bullet 0.3 \mathrm{~A}} \\ & \mathrm{~L}_{\text {MIN }}=\frac{\left(\mathrm{V}_{\text {IN(MIN })}-0.4 \mathrm{~V}\right) \cdot\left(2 \cdot \mathrm{DC}_{\text {MAX }}-1\right)}{1.25 \cdot\left(\mathrm{DC}_{\text {MAX }}-300 \mathrm{~ns} \bullet \mathrm{f}_{\mathrm{OSC}}\right) \cdot \mathrm{f}_{\mathrm{OSC}} \cdot\left(1-\mathrm{DC}_{\text {MAX }}\right)} \\ & \mathrm{L}_{\text {MAX }}=\frac{\left(\mathrm{V}_{\text {IN(MIN }}-0.4 \mathrm{~V}\right) \cdot \mathrm{DC}_{\text {MAX }}}{\mathrm{f}_{\mathrm{OSC}} \cdot 0.08 \mathrm{~A}} \end{aligned}$ | (1) (2) (3) |

- Solve equations 1,2 and 3 for a range of $L$ values
- The minimum of the $L$ value range is the higher of $\mathrm{L}_{\text {TYP }}$ and $\mathrm{L}_{\text {MIN }}$
- The maximum of the $L$ value range is $L_{\text {max }}$
- $\mathrm{L}=\mathrm{L} 1$ = L2 for coupled inductors
- $L=L 1| | L 2$ for uncoupled inductors

| Step 4: | $\mathrm{I}_{\text {RIPPLE(MIN })}=\frac{\left(\mathrm{V}_{\text {IN(MIN })}-0.4 \mathrm{~V}\right) \cdot D \mathrm{C}_{\text {MAX }}}{\mathrm{f}_{\mathrm{OSC}} \bullet \mathrm{L}}$ |
| :--- | :--- |
| $\mathrm{I}_{\text {RIPPLE }}$ |  |

$\mathrm{I}_{\text {RIPPLE(MAX })}=\frac{\left(\mathrm{V}_{\operatorname{IN(MAX)}}-0.4 \mathrm{~V}\right) \cdot \mathrm{D} \mathrm{C}_{\text {MIN }}}{\mathrm{f}_{\mathrm{OSC}} \cdot \mathrm{L}}$
Step 5:
Iout
$\mathrm{I}_{\text {OUT(MIN) }}=\left(1 \mathrm{~A}-\frac{\mathrm{I}_{\text {RIPPLE(MIIN })}}{2}\right) \cdot\left(1-\mathrm{DC}_{\text {MAX }}\right)$
$I_{\text {OUT(MAX) }}=\left(1 A-\frac{I_{\text {RIPPLE(MAX) }}}{2}\right) \cdot\left(1-D C_{\text {MIN }}\right)$

| $\overline{\text { Step } 6:}$ D1 | $\mathrm{V}_{\mathrm{R}}>\mathrm{V}_{\text {IN }}+\left\|\mathrm{V}_{\text {OUT }}\right\| ; \mathrm{I}_{\text {IVG }}>\mathrm{I}_{\text {OUT }}$ |
| :---: | :---: |
| $\begin{aligned} & \text { Step 7: } \\ & \text { c. } \end{aligned}$ | C1 $\geq 1 \mu \mathrm{~F} ; \mathrm{V}_{\text {RATIIGG }} \geq \mathrm{V}_{\text {IN(MAX }}+\left\|\mathrm{V}_{\text {OUT }}\right\|$ |
| Step 8: <br> Cout | $\mathrm{C}_{\text {OUT }} \geq \frac{\mathrm{I}_{\text {RIPPLE(MAX })}}{8 \bullet \mathrm{f}_{\text {OSC }}\left(0.005 \cdot\left\|V_{\text {OUT }}\right\|\right)}$ |
| $\begin{aligned} & \text { Step 9: } \\ & \mathrm{C}_{\mathrm{IN}} \end{aligned}$ | $\begin{aligned} & \mathrm{C}_{\text {IN }} \geq \mathrm{C}_{\mathrm{VIN}}+\mathrm{C}_{\text {PWR }} \geq \\ & \frac{1 \mathrm{~A} \cdot \mathrm{DC}_{\text {MAX }}}{40 \cdot \mathrm{f}_{\mathrm{OSC}} \cdot 0.005 \cdot \mathrm{~V}_{\text {IN(MIN })}}+\frac{\mathrm{I}_{\text {RIPPLE(MAX }}}{8 \cdot \mathrm{f}_{\mathrm{OSC}} \cdot 0.005 \cdot \mathrm{~V}_{\text {IN(MAX }}} \end{aligned}$ <br> - Refer to the Capacitor Selection Section for definition of CVIN and CPWR |
| $\begin{aligned} & \text { Step 10: } \\ & \mathbf{R}_{\text {FBX }} \end{aligned}$ | $R_{\text {FBX }}=\frac{\left\|V_{\text {OUT }}\right\|+3 \mathrm{mV}}{83.3 \mu \mathrm{~A}}$ |
| $\begin{aligned} & \text { Step 11: } \\ & \mathbf{R}_{\mathbf{T}} \end{aligned}$ | $\mathrm{R}_{\mathrm{T}}=\frac{85.5}{\mathrm{f}_{\text {OSC }}}-1 ; \mathrm{f}_{\text {OSC }}$ in MHz and $\mathrm{R}_{\mathrm{T}}$ in $k \Omega$ |

Note 1: This table uses 1A for the peak switch current. Refer to the Electrical Characteristics Table and Typical Performance Characteristics plots for the peak switch current at an operating duty cycle.
Note 2: The final values for $\mathrm{C}_{0 U T}, \mathrm{C}_{\text {IN }}$ and C 1 may deviate from the previous equations in order to obtain desired load transient performance.

TYPICAL APPLICATIONS
1.5MHz, 5V to 12V Output Boost Converter

L1: WÜRTH $15 \mu \mathrm{H}$ WE-LQS 74404054150
D1: DIODES INC. SBR1U40LP
$\mathrm{C}_{\mathrm{IN}}: 2.2 \mu \mathrm{~F}, 35 \mathrm{~V}, 0805, \mathrm{X} 7 \mathrm{R}$
Cout: $4.7 \mu \mathrm{~F}, 16 \mathrm{~V}, 0805, \mathrm{X7R}$

Efficiency and Power Loss

8580 TAO2b

50mA to 150 mA to 50 mA Output Load Step

## TYPICAL APPLICATIONS

750kHz, -15V Output Inverting Converter Accepts 5V to 40V Input

L1, L2: COILCRAFT $22 \mu \mathrm{H}$ MSD7342-223
D1: CENTRAL SEMI CMMSH1-60
$\mathrm{C}_{\mathrm{IN}}: 4.7 \mu \mathrm{~F}, 50 \mathrm{~V}, 1206, \mathrm{X} 5 \mathrm{R}$
Cout: $4.7 \mu \mathrm{~F}, 25 \mathrm{~V}, 1206, \mathrm{X7R}$
C1: 1 $\mu \mathrm{F}, 100 \mathrm{~V}, 0805, \mathrm{X7S}$

Efficiency and Power Loss ( $\mathrm{V}_{\mathrm{IN}}=12 \mathrm{~V}$ )

8580 TA03b

60 mA to 160 mA to $\mathbf{6 0 m A}$ Output Load Step ( $\mathrm{V}_{\mathbf{I N}}=12 \mathrm{~V}$ )

## TYPICAL APPLICATIONS

1.2MHz Inverting Converter Generates -48V Output From 12V Input

L1: COOPER $150 \mu \mathrm{H}$ DR74-151
L2: COOPER $330 \mu \mathrm{H}$ DR74-331
D1: DIODES, INC. DFLS1100
$\mathrm{C}_{\mathrm{IN}}$ : $1 \mu \mathrm{~F}, 50 \mathrm{~V}, 0805, \mathrm{X7R}$
Cout: 2.2 $2 \mathrm{~F}, 100 \mathrm{~V}, 1206, \mathrm{X7R}$
C1: $1 \mathrm{HF}, 100 \mathrm{~V}, 0805, \mathrm{X} 7 \mathrm{~S}$
C2: $2.2 \mu \mathrm{~F}, 100 \mathrm{~V}, 1206, \mathrm{X} 7 \mathrm{~S}$

## TYPICAL APPLICATIONS

VFD (Vacuum Fluorescent Display) Power Supply Switches at 1MHz
Danger High Voltage! Operation by High Voltage Trained Personnel Only
