# Dual, 16-Bit, 5Msps Differential Input ADC with Wide Input Common Mode Range DESCRIPTIOn 

## fGATURES

- 5Msps Throughput Rate
- $\pm 4$ LSB INL (Typ)
- Guaranteed 16-Bit, No Missing Codes
- 8V ${ }^{\text {P-p }}$ Differential Inputs with Wide Input Common Mode Range
- 81dB SNR (Typ) at $\mathrm{f}_{\mathrm{IN}}=2 \mathrm{MHz}$
- -85dB THD (Typ) at $\mathrm{f}_{\mathrm{IN}}=2 \mathrm{MHz}$
- Guaranteed Operation to $125^{\circ} \mathrm{C}$
- Single 3.3 V or 5 V Supply
- Low Drift (20ppm/ ${ }^{\circ} \mathrm{C} \mathrm{Max}$ ) 2.048V or 4.096V Internal Reference
- 1.8V to 2.5V I/O Voltages
- CMOS or LVDS SPI-Compatible Serial I/O
- Power Dissipation $40 \mathrm{~mW} / \mathrm{Ch}$ (Typ)
- Small 28-Lead ( $4 \mathrm{~mm} \times 5 \mathrm{~mm}$ ) QFN Package

## APPLICATIONS

- High Speed Data Acquisition Systems
- Communications
- Remote Data Acquisition
- Imaging
- Optical Networking
- Automotive
- Multiphase Motor Control

The LTC ${ }^{\circledR} 2323-16$ is a low noise, high speed dual 16 -bit successive approximation register (SAR) ADC with differential inputs and wide input common mode range. Operating from a single 3.3V or 5V supply, the LTC2323-16 has an $8 V_{\text {p-p }}$ differential input range, making it ideal for applications which require a wide dynamic range with high common mode rejection. The LTC2323-16 achieves $\pm 4$ LSB INL typical, no missing codes at 16 bits and 81dB SNR.
The LTC2323-16 has an onboard low drift (20ppm/ ${ }^{\circ} \mathrm{C}$ max) 2.048 V or 4.096 V temperature-compensated reference. The LTC2323-16 also has a high speed SPI-compatible serial interface that supports CMOS or LVDS. The fast 5Msps per channel throughput with one-cycle latency makes the LTC2323-16 ideally suited for a wide variety of high speed applications. The LTC2323-16 dissipates only 40 mW per channel and offers nap and sleep modes to reduce the power consumption to $5 \mu \mathrm{~W}$ for further power savings during inactive periods.

| twake | REFOUT1,2 Wakeup Time | $C_{\text {REFOUT } 1,2}=10 \mu \mathrm{~F}$ |  |  | 10 |  | ms |

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: All voltage values are with respect to ground.
Note 3: When these pin voltages are taken below ground, or above $V_{D D}$ or $\mathrm{OV}_{\mathrm{DD}}$, they will be clamped by internal diodes. This product can handle input currents up to 100 mA below ground, or above $\mathrm{V}_{\mathrm{DD}}$ or $\mathrm{OV}_{\mathrm{DD}}$, without latch-up.
Note 4: $\mathrm{V}_{\mathrm{DD}}=5 \mathrm{~V}, 0 \mathrm{~V}_{\mathrm{DD}}=2.5 \mathrm{~V}$, REFOUT1,2 $=4.096 \mathrm{~V}, \mathrm{f}_{\mathrm{SMPL}}=5 \mathrm{MHz}$.
Note 5: Recommended operating conditions.
Note 6: Integral nonlinearity is defined as the deviation of a code from a straight line passing through the actual endpoints of the transfer curve. The deviation is measured from the center of the quantization band.
Note 7: Bipolar zero error is the offset voltage measured from -0.5 LSB when the output code flickers between 0000000000000000 and 1111 11111111 1111. Full-scale bipolar error is the worst-case of -FS or
+FS un-trimmed deviation from ideal first and last code transitions and includes the effect of offset error.
Note 8: All specifications in dB are referred to a full-scale $\pm 4.096 \mathrm{~V}$ input with REFIN $=4.096 \mathrm{~V}$.
Note 9: When REFOUT1,2 is overdriven, the internal reference buffer must be turned off by setting REFINT $=0 \mathrm{~V}$.
Note 10: $f_{\text {SMPL }}=5 \mathrm{MHz}$, $\mathrm{I}_{\text {REFBUF }}$ varies proportionally with sample rate.
Note 11: Guaranteed by design, not subject to test.
Note 12: Parameter tested and guaranteed at $O V_{D D}=1.71 \mathrm{~V}$ and $O V_{D D}=2.5 \mathrm{~V}$.
Note 13: tsck of $9.4 n s$ maximum allows a shift clock frequency up to 105 MHz for rising edge capture.
Note 14: Temperature coefficient is calculated by dividing the maximum change in output voltage by the specified temperature range.
Note 15: $\overline{\mathrm{CNV}}$ is driven from a low jitter digital source, typically at OV DD logic levels. This input pin has a TTL style input that will draw a small amount of current.

## PIn functions

$V_{D D}$ (Pins 1, 8): Power Supply. Bypass $V_{D D}$ to GND with a $10 \mu \mathrm{~F}$ ceramic and a $0.1 \mu \mathrm{~F}$ ceramic close to the part. The $V_{D D}$ pins should be shorted together and driven from the same supply.
$\mathrm{A}_{\mathrm{IN} 2^{+}}, \mathrm{A}_{\mathrm{IN} 2^{-}}$(Pins 2, 3): Analog Differential Input Pins. Full-scale range ( $A_{I N 2^{+}}-A_{I N 2^{-}}$) is $\pm$REFOUT2 voltage. These pins can be driven from $V_{D D}$ to $G N D$.
GND (Pins 4, 5, 10, 29): Ground. These pins and exposed pad (Pin 29) must be tied directly to a solid ground plane.
$A_{\text {IN1 }}$, $A_{\text {IN1+ }}$ (Pins 6, 7): Analog Differential Input Pins. Full-scale range $\left(A_{I N 1+}-A_{I N 1^{-}}\right)$is $\pm$REFOUT1 voltage. These pins can be driven from $V_{D D}$ to GND.
 puts the internal sample-and-hold into the hold mode and starts a conversion cycle. $\overline{\text { CNV }}$ must be driven by a low jitter clock as shown in the application circuit on page 26. The $\overline{\mathrm{CNV}}$ pin is unaffected by the $\overline{\mathrm{CMOS}} / \mathrm{LVDS}$ pin.

REFRTN1 (Pin 11): Reference Buffer 1 Output Return. Bypass REFRTN1 to REFOUT1. Do not tie the REFRTN1 pin to the ground plane.
REFOUT1 (Pin 12): Reference Buffer 1 Output. An onboard buffer nominally outputs 4.096 V to this pin. This pin is referred to REFRTN1 and should be decoupled closely to the pin (no vias) with a $0.1 \mu \mathrm{~F}$ (X7R, 0402 size) capacitor and a $10 \mu \mathrm{~F}$ ( $\mathrm{X} 5 \mathrm{R}, 0805$ size) ceramic capacitor in parallel. The internal buffer driving this pin may be disabled by grounding the REFINT pin. If the buffer is disabled, an external reference may drive this pin in the range of 1.25 V to 5 V .

VBYP1 (Pin 13): Bypass this internally supplied pin to ground with a $1 \mu \mathrm{~F}$ ceramic capacitor. The nominal output voltage on this pin is 1.6 V .
OV ${ }_{\text {DD }}$ (Pin 14): I/O Interface Digital Power. The range of $0 \mathrm{~V}_{\mathrm{DD}}$ is 1.71 V to 2.5 V . This supply is nominally set to the same supply as the host interface (CMOS: 1.8 V or 2.5 V , LVDS: 2.5 V ). Bypass OV $\mathrm{DD}^{\text {to }}$ OGND with a $0.1 \mu \mathrm{~F}$ capacitor.

SDO1+, ${ }^{+}$SDO1$^{-}$(Pins 15, 16): Channel 1 Serial Data Output. The conversion result is shifted MSB first on each falling edge of SCK. In CMOS mode, the result is output on $\mathrm{SDO1}^{+}$. The logic level is determined by $\mathrm{OV}_{\mathrm{DD}}$. Do not connect SD01-. In LVDS mode, the result is output differentially on SDO1+ and SD01 ${ }^{-}$. These pins must be differentially terminated by an external $100 \Omega$ resistor at the receiver (FPGA).

CLKOUT ${ }^{+}$, CLKOUT ${ }^{-}$(Pins 17, 18): Serial Data Clock Output. CLKOUT provides a skew-matched clock to latch the SDO output at the receiver. In CMOS mode, the skewmatched clock is output on CLKOUT ${ }^{+}$. The logic level is determined by OV ${ }_{\text {DD }}$. Do not connect CLKOUT ${ }^{-}$. For low throughput applications using SCK to latch the SDO output, CLKOUT ${ }^{+}$can be disabled by tying CLKOUT ${ }^{-}$to $\mathrm{OV}_{\mathrm{DD}}$. In LVDS mode, the skew-matched clock is output differentially on CLKOUT+ and CLKOUT${ }^{-}$. These pins must be differentially terminated by an external $100 \Omega$ resistor at the receiver (FPGA).

SDO2+, SDO2 Output. The conversion result is shifted MSB first on each falling edge of SCK. In CMOS mode, the result is output on $\mathrm{SDO2}^{+}$. The logic level is determined by $\mathrm{OV}_{\mathrm{DD}}$. Do not connect SDO2‥ In LVDS mode, the result is output differentially on SDO2 ${ }^{+}$and SDO2 ${ }^{-}$. These pins must be differentially terminated by an external $100 \Omega$ resistor at the receiver (FPGA).
SCK ${ }^{+}$, SCK ${ }^{-}$(Pins 21, 22): Serial Data Clock Input. The falling edge of this clock shifts the conversion result MSB first onto the SDO pins. In CMOS mode, drive SCK ${ }^{+}$with a single-ended clock. The logic level is determined by $\mathrm{OV}_{\mathrm{DD}}$. Do not connect SCK ${ }^{-}$. In LVDS mode, drive SCK ${ }^{+}$ and SCK ${ }^{-}$with a differential clock. These pins must be differentially terminated by an external $100 \Omega$ resistor at the receiver (ADC).
OGND (Pin 23): I/O Ground. This ground must be tied to the ground plane at a single point. $\mathrm{OV}_{\mathrm{DD}}$ is bypassed to this pin.

## PIn functions

VBYP2 (Pin 24): Bypass this internally supplied pin to ground with a $1 \mu \mathrm{~F}$ ceramic capacitor. The nominal output voltage on this pin is 1.6 V
CMOS/LVDS (Pin 25): I/O Mode Select. Ground this pin to enable CMOS mode, tie to OV $\mathrm{VD}_{\mathrm{D}}$ to enable LVDS mode. Float this pin to enable low power LVDS mode.
REFOUT2 (Pin 26): Reference Buffer 2 Output. An onboard buffer nominally outputs 4.096 V to this pin. This pin is referred to REFRTN2 and should be decoupled closely to the pin (no vias) with a $0.1 \mu \mathrm{~F}$ (X7R, 0402 size) capacitor and a $10 \mu \mathrm{~F}$ (X5R, 0805 size) ceramic capacitor in parallel. The internal buffer driving this pin may be disabled by grounding the REFINT pin. If the buffer is disabled, an external reference may drive this pin in the range of 1.25 V to $\mathrm{V}_{\mathrm{DD}}$.

REFRTN2 (Pin 27): Reference Buffer 2 Output Return. Bypass REFRTN2 to REFOUT2. Do not tie the REFRTN2 pin to the ground plane.
REFINT (Pin 28): Reference Buffer Output Enable. Tie to $V_{D D}$ when using the internal reference. Tie to ground to disable the internal REFOUT1 and REFOUT2 buffers for use with external voltage references. This pin has a 500 k internal pull-up to $V_{D D}$.
Exposed Pad (Pin 29): Ground. Solder this pad to ground.
functional block diagram

TIMING DIAGRAM

## APPLICATIONS INFORMATION

## OVERVIEW

The LTC2323-16 is a low noise, high speed 16-bit successive approximation register (SAR) ADC with differential inputs and a wide input common mode range. Operating from a single 3.3 V or 5 V supply, the LTC2323-16 has an $8 \mathrm{~V}_{\text {P-p }}$ differential input range, making it ideal for applications which require a wide dynamic range. The LTC232316 achieves $\pm 4$ LSB INL typical, no missing codes at 16 bits and 81dB SNR.

The LTC2323-16 has an onboard reference buffer and low drift ( $20 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ max) 4.096 V temperature-compensated reference. The LTC2323-16 also has a high speed SPIcompatible serial interface that supports CMOS or LVDS. The fast 5Msps per channel throughput with one-cycle latency makes the LTC2323-16 ideally suited for a wide variety of high speed applications. The LTC2323-16 dissipates only 45 mW per channel. Nap and sleep modes are also provided to reduce the power consumption of the LTC2323-16 during inactive periods for further power savings.

## CONVERTER OPERATION

The LTC2323-16 operates in two phases. During the acquisition phase, the sample capacitor is connected to the analog input pins $A_{\text {IN }}$ and $A_{\text {IN- }}$ to sample the differential analog input voltage, as shown in Figure 3. A falling edge on the CNV pin initiates a conversion. During the conversion phase, the 16-bit CDAC is sequenced through a successive approximation algorithm for each

Figure 2. LTC2323-16 Transfer Function
input SCK pulse, effectively comparing the sampled input with binary-weighted fractions of the reference voltage (e.g., $\mathrm{V}_{\text {REFOUT }} / 2$, $\mathrm{V}_{\text {REFOUT }} / 4 \ldots \mathrm{~V}_{\text {REFOUT }} / 32768$ ) using a differential comparator. At the end of conversion, a CDAC output approximates the sampled analog input. The ADC control logic then prepares the 16-bit digital output code for serial transfer.

## TRANSFER FUNCTION

The LTC2323-16 digitizes the full-scale voltage of $2 \times$ REFOUT1,2 into $2^{16}$ levels, resulting in an LSB size of $125 \mu \mathrm{~V}$ with $\mathrm{REFBUF}=4.096 \mathrm{~V}$. The ideal transfer function is shown in Figure 2. The output data is in 2's complement format.

## Analog Input

The differential inputs of the LTC2323-16 provide great flexibility to convert a wide variety of analog signals with no configuration required. The LTC2323-16 digitizes the difference voltage between the $A_{I N+}$ and $A_{I N^{-}}$pins while supporting a wide common mode input range. The analog input signals can have an arbitrary relationship to each other, provided that they remain between $\mathrm{V}_{\mathrm{DD}}$ and GND. The LTC2323-16 can also digitize more limited classes of analog input signals such as pseudo-differential unipolar/ bipolar and fully differential with no configuration required.

The analog inputs of the LTC2323-16 can be modeled by the equivalent circuit shown in Figure 3. The back-toback diodes at the inputs form clamps that provide ESD

Figure 3. The Equivalent Circuit for the Differential Analog Input of the LTC2323-16

## APPLICATIONS INFORMATION

protection. In the acquisition phase, $10 \mathrm{pF}\left(\mathrm{C}_{\mid \mathrm{N}}\right)$ from the sampling capacitor in series with approximately $15 \Omega$ ( $R_{\text {ON }}$ ) from the on-resistance of the sampling switch is connected to the input. Any unwanted signal that is common to both inputs will be reduced by the common mode rejection of the ADC sampler. The inputs of the ADC core draw a small current spike while charging the $\mathrm{C}_{\text {IN }}$ capacitors during acquisition.

## Single-Ended Signals

Single-ended signals can be directly digitized by the LTC2323-16. These signals should be sensed pseudodifferentially for improved common mode rejection. By connecting the reference signal (e.g., ground sense) of the main analog signal to the other $A_{\text {IN }}$ pin, any noise or disturbance common to the two signals will be rejected by the high CMRR of the ADC. The LTC2323-16 flexibility handles both pseudo-differential unipolar and bipolar
signals, with no configuration required. The wide common mode input range relaxes the accuracy requirements of any signal conditioning circuits prior to the analog inputs.

## Pseudo-Differential Bipolar Input Range

The pseudo-differential bipolar configuration represents driving one of the analog inputs at a fixed voltage, typically $\mathrm{V}_{\text {REF }} / 2$, and applying a signal to the other $\mathrm{A}_{\text {IN }}$ pin. In this case the analog input swings symmetrically around the fixed input yielding bipolar two's complement output codes with an ADC span of half of full-scale. This configuration is illustrated in Figure 4, and the corresponding transfer function in Figure 5. The fixed analog input pin need not be set at $V_{\text {REF }} / 2$, but at some point within the $V_{D D}$ rails allowing the alternate input to swing symmetrically around this voltage. If the input signal ( $A_{I N^{+}}-A_{I N^{-}}$) swings beyond $\pm$ REFOUT1,2/2, valid codes will be generated by the ADC and must be clamped by the user, if necessary.

Figure 4. Pseudo-Differential Bipolar Application Circuit

Figure 5. Pseudo-Differential Bipolar Transfer Function

## APPLICATIONS INFORMATION

## Pseudo-Differential Unipolar Input Range

The pseudo-differential unipolar configuration represents driving one of the analog inputs at ground and applying a signal to the other $A_{\text {IN }}$ pin. In this case, the analog input swings between ground and $\mathrm{V}_{\text {REF }}$ yielding unipolar two's
complement output codes with an ADC span of half of fullscale. This configuration is illustrated in Figure 6, and the corresponding transfer function in Figure 7. If the input signal ( $A_{\mathrm{IN}^{+}}-\mathrm{A}_{\mathrm{IN}}$ ) swings negative, valid codes will be generated by the ADC and must be clamped by the user, if necessary.

Figure 6. Pseudo-Differential Unipolar Application Circuit

Figure 7. Pseudo-Differential Unipolar Transfer Function

## APPLICATIONS INFORMATION

## Single-Ended-to-Differential Conversion

While single-ended signals can be directly digitized as previously discussed, single-ended to differential conversion circuits may also be used when higher dynamic range is desired. By producing a differential signal at the inputs of the LTC2323-16, the signal swing presented to the ADC is maximized, thus increasing the achievable SNR.

The LT®1819 high speed dual operational amplifier is recommended for performing single-ended-to-differential conversions, as shown in Figure 8. In this case, the first amplifier is configured as a unity-gain buffer and the single-ended input signal directly drives the high impedance input of this amplifier.

## Fully-Differential Inputs

Toachieve the full distortion performance of the LTC2323-16, a low distortion fully-differential signal source driven through the LT1819 configured as two unity-gain buffers, as shown in Figure 9, can be used. This circuit achieves the full data sheet THD specification of -85 dB at input frequencies of 500 kHz and less. Data sheet typical performance curves taken at higher frequencies used a harmonic

Figure 8. Single-Ended to Differential Driver
rejection filter between the ADC and the signal source to eliminate the op amp as the dominant source of distortion.
The fully-differential configuration yields an analog input span ( $A_{I N^{+}}-A_{I N^{-}}$) of $\pm$REFOUT1,2. In this configuration, the input signal is driven on each AIN pin, typically at equal spans but opposite polarity. This yields a high common mode rejection on the input signals. The common mode voltage of the analog input can be anywhere within the $V_{D D}$ input range, but will be limited by the peak swing of the full-range input signal. For example, if the internal reference is used with $V_{D D}=5 V_{D C}$, the full-range input span will be $\pm 4.096 \mathrm{~V}$. Half of the input span is typically driven on each AIN pin, yielding a signal span for each AIN pin of 4.096 V p-p. This leaves $\sim 0.9 \mathrm{~V}$ of common mode variation tolerance. When using external references, it is possible to increase common mode tolerance by compressing the ADC full-range codes into a tighter range. For example, using an external 2.048 V reference with $V_{D D}$ $=5 \mathrm{~V}$ the total span would be $\pm 2.048 \mathrm{~V}$ and each AIN span would be limited to 2.048 V P-p allowing a common mode range of $\sim 3 \mathrm{~V}$. Compressing the input span would incur a SNR penalty of approximately 2 dB . Input span compression may be useful if single-supply analog input drivers

Figure 9. LT1819 Buffering a Fully-Differential Signal Source

## APPLICATIONS INFORMATION

are used which cannot swing rail-to-rail. The fully-differential configuration is illustrated in Figure 10, with the corresponding transfer function illustrated in Figure 11.

## INPUT DRIVE CIRCUITS

A low impedance source can directly drive the high impedance inputs of the LTC2323-16 without gain error. A high impedance source should be buffered to minimize settling time during acquisition and to optimize the distortion performance of the ADC. Minimizing settling time is
important even for DC inputs, because the ADC inputs draw a current spike when during acquisition.
For best performance, a buffer amplifier should be used to drive the analog inputs of the LTC2323-16. The amplifier provides low output impedance to minimize gain error and allow for fast settling of the analog signal during the acquisition phase. It also provides isolation between the signal source and the ADC inputs, which draw a small current spike during acquisition.

Figure 10. Fully-Differential Application Circuit

Figure 11. Fully-Differential Transfer Function

## APPLICATIONS INFORMATION

## Input Filtering

The noise and distortion of the buffer amplifier and signal source must be considered since they add to the ADC noise and distortion. Noisy input signals should be filtered prior to the buffer amplifier input with a low bandwidth filter to minimize noise. The simple 1-pole RC lowpass filter shown in Figure 12 is sufficient for many applications.
The input resistor divider network, sampling switch onresistance ( $\mathrm{R}_{\text {ON }}$ ) and the sample capacitor ( $\mathrm{C}_{\mathrm{IN}}$ ) form a second lowpass filter that limits the input bandwidth to the ADC core to 110 MHz . A buffer amplifier with a low noise density must be selected to minimize the degradation of the SNR over this bandwidth.

High quality capacitors and resistors should be used in the RC filters since these components can add distortion. NPO and silver mica type dielectric capacitors have excellent linearity. Carbon surface mount resistors can generate distortion from self heating and from damage that may occur during soldering. Metal film surface mount resistors are much less susceptible to both problems.

## ADC REFERENCE

## Internal Reference

The LTC2323-16 has an on-chip, low noise, low drift (20ppm/ ${ }^{\circ} \mathrm{C}$ max), temperature compensated bandgap reference. It is internally buffered and is available at REFOUT1,2 (Pins 12, 26). The reference buffer gains the internal reference voltage to 4.096 V for supply voltages $\mathrm{V}_{\mathrm{DD}}=5 \mathrm{~V}$ and to 2.048 V for $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$. Bypass REFOUT1,2 to REFRTN1,2 with the parallel combination of a $0.1 \mu \mathrm{~F}$ (X7R, 0402 size) capacitor and a $10 \mu \mathrm{~F}$ (X5R, 0805 size) ceramic capacitor to compensate the reference buffer and minimize noise. The $0.1 \mu \mathrm{~F}$ capacitor should be as close as possible to the LTC2323-16 package to minimize wiring inductance. Tie the REFINT pin to $V_{D D}$ to enable the internal reference buffer.

Table 1. REFOUT1,2 Sources and Ranges vs $V_{D D}$

| $\mathbf{V}_{\text {DD }}$ | REFINT <br> PIN | REFOUT1,2 PIN | DIFFERENTIAL |
| :--- | :---: | :---: | :---: |
| SPAN |  |  |  |

Figure 12. Input Signal Chain

## APPLICATIONS InFORMATION

## External Reference

The internal reference buffer can also be overdriven from 1.25 V to 5 V with an external reference at REFOUT1,2 as shown in Figure 13 (b and c). To do so, REFINT must be grounded to disable the reference buffer. A 55k internal resistance loads the REFOUT1,2 pins when the reference buffer is disabled. To maximize the input signal swing and corresponding SNR, the LTC6655-5 is recommended when overdriving REFOUT. The LTC6655-5 offers the same small size, accuracy, drift and extended temperature range as the LTC6655-4.096. By using a 5 V reference, a higher SNR can be achieved. We recommend bypassing the LTC6655-5 with a parallel combination of
a $0.1 \mu \mathrm{~F}$ (X7R, 0402 size) ceramic capacitor and a $10 \mu \mathrm{~F}$ ceramic capacitor (X5R, 0805 size) close to each of the REFOUT1,2 and REFRTN1,2 pins.

## Internal Reference Buffer Transient Response

The REFOUT1,2 pins of the LTC2323-16 draw charge ( $Q_{\text {CONV }}$ ) from the external bypass capacitors during each conversion cycle. If the internal reference buffer is overdriven, the external reference must provide all of this charge with a $D C$ current equivalent to $I_{\text {REF }}=Q_{\text {CONV }} / \mathrm{t}_{\text {CYC }}$. Thus, the DC current draw of REFOUT1,2 depends on the sampling rate and output code. In applications where a burst of samples is taken after idling for long

(13a) LTC2323-16 Internal Reference Circuit

(13c) LTC2323-16 with Different External Reference Voltages

Figure 13. Reference Connections

## APPLICATIONS InFORMATION

periods, as shown in Figure 14 , I REFBUF quickly goes from approximately $\sim 75 \mu \mathrm{~A}$ to a maximum of $500 \mu \mathrm{~A}$ for REFOUT $=5 \mathrm{~V}$ at 5 Msps . This step in DC current draw triggers a transient response in the external reference that must be considered since any deviation in the voltage at REFOUT will affect the accuracy of the output code. Due to the one-cycle conversion latency, the first conversion result at the beginning of a burst sampling period will be invalid. If an external reference is used to overdrive REFOUT1,2 the fast settling LTC6655 reference is recommended.

Figure 14. CNV Waveform Showing Burst Sampling

## DYNAMIC PERFORMANCE

Fast Fourier transform (FFT) techniques are used to test the ADC's frequency response, distortion and noise at the rated throughput. By applying a low distortion sine wave and analyzing the digital output using an FFT algorithm, the ADC's spectral content can be examined for frequencies outside the fundamental. The LTC2323-16 provides guaranteed tested limits for both AC distortion and noise measurements.

## Signal-to-Noise and Distortion Ratio (SINAD)

The signal-to-noise and distortion ratio (SINAD) is the ratio between the RMS amplitude of the fundamental input frequency and the RMS amplitude of all other frequency components at the A/D output. The output is bandlimited to frequencies from above DC and below half the sampling frequency. Figure 16 shows that the LTC2323-16 achieves a typical SINAD of 80 dB at a 5 MHz sampling rate with a 2.2MHz input.

## Signal-to-Noise Ratio (SNR)

The signal-to-noise ratio (SNR) is the ratio between the RMS amplitude of the fundamental input frequency and the RMS amplitude of all other frequency components except the first five harmonics and DC. Figure 16 shows that the LTC2323-16 achieves a typical SNR of 81dB at a 5 MHz sampling rate with a 2.2 MHz input.

Figure 15. Transient Response of the LTC2323-16

Figure 16. 32k Point FFT of the LTC2323-16

## APPLICATIONS INFORMATION

Total Harmonic Distortion (THD)
Total harmonic distortion (THD) is the ratio of the RMS sum of all harmonics of the input signal to the fundamental itself. The out-of-band harmonics alias into the frequency band between DC and half the sampling frequency ( $\mathrm{f}_{\mathrm{SMPL}} / 2$ ). THD is expressed as:

$$
T H D=20 \log \frac{\sqrt{V 2^{2}+V 3^{2}+V 4^{2}+\ldots+V_{N}^{2}}}{V 1}
$$

where V 1 is the RMS amplitude of the fundamental frequency and V 2 through $\mathrm{V}_{\mathrm{N}}$ are the amplitudes of the second through Nth harmonics.

## POWER CONSIDERATIONS

The LTC2323-16 requires two power supplies: the 5 V power supply ( $V_{D D}$ ), and the digital input/output interface power supply ( $0 V_{D D}$ ). The flexible $0 V_{D D}$ supply allows
the LTC2323-16 to communicate with any digital logic operating between 1.8 V and 2.5 V . When using LVDS I/O, the $0 \mathrm{~V}_{\mathrm{DD}}$ supply must be set to 2.5 V .

## Power Supply Sequencing

The LTC2323-16 does not have any specific power supply sequencing requirements. Care should be taken to adhere to the maximum voltage relationships described in the Absolute Maximum Ratings section. The LTC232316 has a power-on-reset (POR) circuit that will reset the LTC2323-16 at initial power-up or whenever the power supply voltage drops below 2 V . Once the supply voltage re-enters the nominal supply voltage range, the POR will reinitialize the ADC. No conversions should be initiated until 10 ms after a POR event to ensure the reinitialization period has ended. Any conversions initiated before this time will produce invalid results.

Figure 17. Power Supply Current of the LTC2323-16 Versus Sampling Rate

## APPLICATIONS InFORMATION

## TIMING AND CONTROL

## $\overline{\text { CNV Timing }}$

A rising edge on $\overline{\mathrm{CNV}}$ initiates the acquisition phase and puts the internal sample-and-hold into the sample mode. A falling edge on CNV puts the internal sample-and-hold into the hold mode and starts a conversion cycle. The $\overline{\text { CNV }}$ pulse must be at least 25 ns wide for proper operation. CNV must be driven by a fast low jitter signal with a fall time from $O V_{D D}$ to below 100 mV of less than 1 ns . To achieve this fast falling edge, the distance from the CNV source to the $\overline{C N V}$ pin should be minimized. The trace for this pulse should be kept as narrow as possible and routed away from adjacent traces or planes to minimize capacitance. The drive strength of the gate driving the CNV line must be sufficient to yield a fast falling edge at the ADC pin to below 100 mV . We recommend the applications circuit on page 26, which uses a high speed flip-flop to generate the CNV pulse to the ADC, eliminating the effect of jitter from the FPGA. If jitter from the FPGA is not a concern, the flip-flop can be eliminated and replaced with an inverter such as the NC7SZ04P5X

## SCK Serial Data Clock Input

The falling edge of this clock shifts the conversion result MSB first onto the SDO pins. A 105MHz external clock must be applied at the SCK pin to achieve 5Msps throughput.

## CLKOUT Serial Data Clock Output

The CLKOUT output provides a skew-matched clock to latch the SDO output at the receiver. The timing skew of the CLKOUT and SDO outputs are matched. For high throughput applications, using CLKOUT instead of SCK to
capture the SDO output eases timing requirements at the receiver. For low throughput speed applications, CLKOUT+ can be disabled by tying CLKOUT ${ }^{-}$to $\mathrm{OV}_{\mathrm{DD}}$.

## Nap/Sleep Modes

Nap mode is a method to save power without sacrificing power-up delays for subsequent conversions. Sleep mode has substantial power savings, but a power-up delay is incurred to allow the reference and power systems to become valid. To enter nap mode on the LTC2323-16, the SCK signal must be held high or low and a series of two CNV pulses must be applied. This is the case for both CMOS and LVDS modes. The second rising edge of $\overline{\text { CNV }}$ initiates the nap state. The nap state will persist until either a single rising edge of SCK is applied, or further $\overline{\text { CNV }}$ pulses are applied. The SCK rising edge will put the LTC2323-16 back into the operational (full-power) state. When in nap mode, two additional pulses will put the LTC2323-16 in sleep mode. When configured for CMOS I/O operation, a single rising edge of SCK can return the LTC2323-16 into operational mode. A 10ms delay is necessary after exiting sleep mode to allow the reference buffer to recharge the external filter capacitor. In LVDS mode, exit sleep mode by supplying a fifth CNV pulse. The fifth pulse will return the LTC2323-16 to operational mode, and further SCK pulses will keep the part from re-entering nap and sleep modes. The fifth SCK pulse also works in CMOS mode as a method to exit sleep. In the absence of SCK pulses, repetitive $\overline{\mathrm{CNV}}$ pulses will cycle the LTC232316 between operational, nap and sleep modes indefinitely.

Refer tothetiming diagrams in Figure 18, Figure 19, Figure 20 and Figure 21 for more detailed timing information about sleep and nap modes.

Figure 21. LTC2323-16 Timing Diagram

## LTC2323-16

## APPLICATIONS INFORMATION

DIGITAL INTERFACE
The LTC2323-16 features a serial digital interface that is simple and straight forward to use. The flexible $O V_{D D}$ supply allows the LTC2323-16 to communicate with any digital logic operating between 1.8 V and 2.5 V . A 105MHz external clock must be applied at the SCK pin to achieve 5Msps throughput.

In addition to a standard CMOS SPI interface, the LTC2323-16 provides an optional LVDS SPI interface to support low noise digital design. The CMOS/LVDS pin is used to select the digital interface mode.

The falling edge of SCK outputs the conversion result MSB first on the SDO pins. CLKOUT provides a skew-matched clock to latch the SDO output at the receiver. The timing
skew of the CLKOUT and SDO outputs are matched. For high throughput applications, using CLKOUT instead of SCK to capture the SDO output eases timing requirements at the receiver.

In CMOS mode, use the SDO1+, SDO2 ${ }^{+}$and CLKOUT ${ }^{+}$ pins as outputs. Use the SCK ${ }^{+}$pin as an input. Do not connect the SDO1${ }^{-}$, SDO2 ${ }^{-}$, SCK $^{-}$and CLKOUT ${ }^{-}$pins, as they each have internal pull-down circuitry to OGND.

In LVDS mode, use the SD01+/SD01 , SDO2 $^{+} /$SDO2 $^{-}$and CLKOUT ${ }^{+} /$CLKOUT $^{-}$pins as differential outputs. These pins must be differentially terminated by an external $100 \Omega$ resistor at the receiver (FPGA). The SCK ${ }^{+} /$SCK $^{-}$pins are differential inputs and must be terminated differentially by an external $100 \Omega$ resistor at the receiver (ADC).

Figure 22. LTC2323 Using the LVDS Interface

## APPLICATIONS InFORMATION

## BOARD LAYOUT

To obtain the best performance from the LTC2323-16, a printed circuit board is recommended. Layout for the printed circuit board (PCB) should ensure the digital and analog signal lines are separated as much as possible. In particular, care should be taken not to run any digital clocks or signals adjacent to analog signals or underneath the ADC.

Figure 23. Layer 1, Top Layer

Figure 24. Layer 2, Ground Plane

## Recommended Layout

The following is an example of a recommended PCB layout. A single solid ground plane is used. Bypass capacitors to the supplies are placed as close as possible to the supply pins. Low impedance common returns for these bypass capacitors are essential to the low noise operation of the ADC. The analog input traces are screened by ground. For more details and information, refer to the DC1996, the evaluation kit for the LTC2323-16.

2. DRAWING NOT TO SCALE
3. ALL DIMENSIONS ARE IN MILLIMETERS
4. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE

MOLD FLASH. MOLD FLASH, IF PRESENT, SHALL NOT EXCEED 0.15 mm ON ANY SIDE
5. EXPOSED PAD SHALL BE SOLDER PLATED
6. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION

ON THE TOP AND BOTTOM OF PACKAGE

## REVISION HISTORY

| REV | DATE | DESCRIPTION | PAGE NUMBER |
| :---: | :---: | :--- | :---: |
| A | $05 / 14$ | Changed y-axis units to dBFS <br> Updated SCK, CLKOUT SDO function descriptions <br> Changed SNR penalty to 2dB from 6dB | 6 |
| B | $4 / 17$ | Changed $\overline{\text { CNV }}$ pin description and Applications Information <br> Changed Fairchild components on Typical Application | $8,20,22$ |
| C | $10 / 17$ | Corrected minimum $\overline{\text { CNV }}$ pulse width to 25ns. | 8,20 |

## TYPICAL APPLICATION

## Low Jitter Clock Timing with RF Sine Generator Using Clock Squaring/Level-Shifting Circuit and Retiming Flip-Flop

## RELATED PARTS

| PART NUMBER | DESCRIPTION | COMMENTS |
| :---: | :---: | :---: |
| ADCs |  |  |
| LTC1407A/LTC1407A-1 | 12-/14-Bit, 3Msps Simultaneous Sampling ADC | 3V Supply, 2-Channel Differential, 1.5Msps per Channel Throughput, Unipolar/Bipolar Inputs, 14mW, MSOP Package |
| LTC2314-14 | 14-Bit, 4.5Msps Serial ADC | $3 \mathrm{~V} / 5 \mathrm{~V}$ Supply, $18 \mathrm{~mW} / 31 \mathrm{~mW}, 20 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ Max Internal Reference, Unipolar Inputs, 8-Lead TSOT-23 Package |
| $\begin{aligned} & \text { LTC2321-16/LTC2321-14/ } \\ & \text { LTC2321-12 } \end{aligned}$ | 16-/14-/12-Bit, 2Msps, Simultaneous Sampling ADCs | $3.3 \mathrm{~V} / 5 \mathrm{~V}$ Supply, $33 \mathrm{~mW} / \mathrm{Ch}, 10 \mathrm{ppm}{ }^{\circ} \mathrm{C}$ Max Internal Reference, Flexible Inputs, $4 \mathrm{~mm} \times 5 \mathrm{~mm}$ QFN-28 Package |
| $\begin{aligned} & \text { LTC2370-16/LTC2368-16/ } \\ & \text { LTC2367-16/LTC2364-16 } \end{aligned}$ | 16-Bit, 2Msps/1Msps/500ksps/250ksps Serial, Low Power ADC | 2.5V Supply, Pseudo-Differential Unipolar Input, 94dB SNR, 5V Input Range, DGC, Pin-Compatible Family in MSOP-16 and $4 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN-16 Packages |
| $\begin{aligned} & \text { LTC2380-16/LTC2378-16/ } \\ & \text { LTC2377-16/LTC2376-16 } \end{aligned}$ | 16-Bit, 2Msps/1Msps/500ksps/250ksps Serial, Low Power ADC | 2.5V Supply, Differential Input, 96.2 dB SNR, $\pm 5 \mathrm{~V}$ Input Range, DGC, Pin-Compatible Family in MSOP-16 and $4 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN-16 Packages |
| DACs |  |  |
| LTC2632 | Dual 12-/10-/8-Bit, SPI V ${ }_{\text {Out }}$ DACs with Internal Reference | 2.7V to 5.5 V Supply Range, $10 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ Reference, External REF Mode, Rail-to-Rail Output, 8-Pin ThinSOTTM Package |
| LTC2602/LTC2612/ <br> LTC2622 | Dual 16-/14-/12-Bit SPI V ${ }_{\text {OUT }}$ DACs with External Reference | $300 \mu \mathrm{~A}$ per DAC, 2.5 V to 5.5 V Supply Range, Rail-to-Rail Output, 8 -Lead MSOP Package |
| References |  |  |
| LTC6655 | Precision Low Drift, Low Noise Buffered Reference | $5 \mathrm{~V} / 4.096 \mathrm{~V} / 3.3 \mathrm{~V} / 3 \mathrm{~V} / 2.5 \mathrm{~V} / 2.048 \mathrm{~V} / 1.25 \mathrm{~V}, 5 \mathrm{ppm} /{ }^{\circ} \mathrm{C}, 0.25 \mathrm{ppm}$ Peak-to-Peak Noise, MSOP-8 Package |
| LTC6652 | Precision Low Drift, Low Noise Buffered Reference | $5 \mathrm{~V} / 4.096 \mathrm{~V} / 3.3 \mathrm{~V} / 3 \mathrm{~V} / 2.5 \mathrm{~V} / 2.048 \mathrm{~V} / 1.25 \mathrm{~V}, 5 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$, 2.1 ppm Peak-to-Peak Noise, MSOP-8 Package |
| Amplifiers |  |  |
| LT1818/LT1819 | $400 \mathrm{MHz}, 2500 \mathrm{~V} / \mathrm{ss}$, 9 mA Single/Dual Operational Amplifiers | -85 dBc Distortion at $5 \mathrm{MHz}, 6 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ Input Noise Voltage, 9 mA Supply Current, Unity-Gain Stable |
| LT1806 | 325MHz, Single, Rail-to-Rail Input and Output, Low Distortion, Low Noise Precision Op Amps | -80dBc Distortion at $5 \mathrm{MHz}, 3.5 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ Input Noise Voltage, 9mA Supply Current, Unity-Gain Stable |
| LT6200 | 165MHz, Rail-to-Rail Input and Output, $0.95 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ Low Noise, Op Amp Family | Low Noise, Low Distortion, Unity-Gain Stable |
