## feATURES

- 1.6 GHz -3dB Bandwidth
- Fixed Gain of 20V/N (26dB)
- -85 dBc IMD3 at 70 MHz (Equivalent $01 \mathrm{P} 3=46.5 \mathrm{dBm}$ )
- -72 dBc IMD3 at 140 MHz (Equivalent $01 P 3=40 \mathrm{dBm}$ )
- $1 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ Internal Op Amp Noise
- $1.5 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ Total Input Referred Noise
- 6.8dB Noise Figure
- Differential Inputs and Outputs
- $50 \Omega$ Input Impedance
- 2.85 V to 3.5 V Supply Voltage
- 45 mA Supply Current ( 135 mW )
- 1 V to 1.6 V Output Common Mode, Adjustable
- DC- or AC-Coupled Operation
- Max Differential Output Swing 4.7Vp-p
- Small 16 -Lead $3 \mathrm{~mm} \times 3 \mathrm{~mm} \times 0.75 \mathrm{~mm}$ QFN Package

## APPLICATIONS

- Differential ADC Driver
- Differential Driver/Receiver
- Single Ended to Differential Conversion
- IF Sampling Receivers
- SAW Filter Interfacing

## DESCRIPTIOn

The LTC ${ }^{\circledR} 6401-26$ is a high-speed differential amplifier targeted at processing signals from DC to 140 MHz . The part has been specifically designed to drive 12 -, 14 - and 16-bit ADCs with low noise and low distortion, but can also be used as a general-purpose broadband gain block.
The LTC6401-26 is easy to use, with minimal support circuitry required. The output common mode voltage is set using an external pin, independent of the inputs, which eliminates the need of transformers or AC-coupling capacitors in many applications. The gain is internally fixed at $26 \mathrm{~dB}(20 \mathrm{~V} / \mathrm{V})$.
The LTC6401-26 saves space and power compared to alternative solutions using IF gain blocks and transformers. The LTC6401-26 is packaged in a compact 16-lead $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ QFN package and operates over the $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ temperature range.
$\overline{\boldsymbol{\Sigma Y}}$, LT, LTC and LTM are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

## LTC6400 AnD LTC6401 SELECTOR GUIDE Please check each datasheet for complete details.

| PART NUMBER | GAIN <br> $(\mathbf{d B})$ | GAIN <br> $(\mathbf{V} / \mathbf{V})$ | Z IN $^{(D I F F E R E N T I A L)}$ <br> $(\Omega)$ | ICC <br> $(\mathbf{m A})$ |
| :--- | :---: | :---: | :---: | :---: |
| LTC6401-8 | 8 | 2.5 | 400 | 45 |
| LTC6401-20 | 20 | 10 | 200 | 50 |
| LTC6401-26 | 26 | 20 | 50 | 45 |
| LTC6400-20 | 20 | 10 | 200 | 90 |
| LTC6400-26 | 26 | 20 | 50 | 85 |

In addition to the LTC6401 family of amplifiers, a lower distortion LTC6400 family is available. The LTC6400 is pin compatible to the LTC6401, and has the same low noise performance. The low distortion of the LTC6400 comes at the expense of higher power consumption. Please refer to the separate LTC6400 data sheets for complete details. Other gain versions from 8 dB to 14 dB will follow.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: Input pins (+IN, -IN) are protected by steering diodes to either supply. If the inputs go beyond either supply rail, the input current should be limited to less than 10 mA .
Note 3: The LTC6401C and LTC6401I are guaranteed functional over the operating temperature range of $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
Note 4: The LTC6401C is guaranteed to meet specified performance from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$. It is designed, characterized and expected to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ but is not tested or QA sampled at these
temperatures. The LTC6401I is guaranteed to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$.
Note 5: Input and output baluns used. See Test Circuit A.
Note 6: Measured using Test Circuit B. $R_{L}=87.5 \Omega$ per output.
Note 7: Since the LTC6401-26 is a feedback amplifier with low output impedance, a resistive load is not required when driving an AD converter. Therefore, typical output power is very small. In order to compare the LTC6401-26 with amplifiers that require $50 \Omega$ output load, the output voltage swing driving a given $R_{L}$ is converted to $\mathrm{OIP}_{3}$ and $\mathrm{P}_{1 \mathrm{~dB}}$ as if it were driving a $50 \Omega$ load. Using this modified convention, $2 V_{P-p}$ is by definition equal to 10 dBm , regardless of actual $R_{L}$.

## PIn fUnCTIONS

$\mathbf{V}^{+}$(Pins 1, 3, 10): Positive Power Supply (Normally tied to 3 V or 3.3 V ). All three pins must be tied to the same voltage. Bypass each pin with 1000 pF and $0.1 \mu \mathrm{~F}$ capacitors as close to the pins as possible.
$V_{\text {OCM }}$ (Pin 2): This pin sets the output common mode voltage. An $0.1 \mu \mathrm{~F}$ external bypass capacitor is recommended.

V $^{-}$(Pins 4, 9, 12, 17): Negative Power Supply. All four pins must be connected to same voltage/ground.
-OUT, +OUT (Pins 5, 8): Unfiltered Outputs. These pins have series $12.5 \Omega$ resistors Rout.
-OUTF, +OUTF (Pins 6, 7): Filtered Outputs. These pins have $50 \Omega$ series resistors and a 2.7 pF shunt capacitor.
$\overline{\text { ENABLE (Pin 11): This pin is a logic input referenced to }}$ $V_{\mathrm{EE}}$. If low, the part is enabled. If high, the part is disabled and draws very low standby current while the internal op amp has high output impedance.
+IN (Pins 13, 14): Positive Input. Pins 13 and 14 are internally shorted together.
-IN (Pins 15, 16): Negative Input. Pins 15 and 16 are internally shorted together.
Exposed Pad (Pin 17): $\mathrm{V}^{-}$. The Exposed Pad must be connected to same voltage/ground as pins 4, 9, 12.

## APPLICATIONS INFORMATION

## Circuit Operation

The LTC6401-26 is a low noise and low distortion fully differential op amp/ADC driver with:

- Operation from DC to $1.6 \mathrm{GHz}-3 \mathrm{~dB}$ bandwidth
- Fixed gain of 20V/V (26dB)
- Differential input impedance $50 \Omega$
- Differential output impedance $25 \Omega$
- Differential impedance of output filter $100 \Omega$

The LTC6401-26 is composed of afully differential amplifier with on chip feedback and output common mode voltage control circuitry. Differential gain and input impedance are set by $25 \Omega / 500 \Omega$ resistors in the feedback network. Small output resistors of $12.5 \Omega$ improve the circuit stability over various load conditions. They also provide a possible external filtering option, which is often desirable when the load is an ADC.
Filter resistors of $50 \Omega$ are available for additional filtering. Lowpass/bandpass filters are easily implemented with just a couple of external components. Moreover, they offer single-ended $50 \Omega$ matching in wideband applications and no external resistor is needed.
The LTC6401-26 is very flexible in terms of I/O coupling. It can be AC- or DC-coupled at the inputs, the outputs or both. Due to the internal connection between input and output, users are advised to keep input common mode voltage between 1 V and 1.6 V for proper operation. If the inputs are AC-coupled, the input common mode voltage is automatically biased close to $\mathrm{V}_{\text {Ocm }}$ and thus no external circuitry is needed for bias. The LTC6401-26 provides an output common mode voltage set by $\mathrm{V}_{0 C M}$, which allows driving ADC directly without external components such as transformer or AC coupling capacitors. The input signal can be either single-ended or differential with only minor difference in distortion performance.

## Input Impedance and Matching

The differential inputimpedance of the LTC6401-26 is $50 \Omega$. The interface between the input of LTC6401-26 and 50 $\Omega$ source is straightforward. One way is to directly connect
them if the source is differential (Figure 1). Another approach is to employ a wideband transformer if the source is single ended (Figure 2). Both methods provide a wideband match. Alternatively, one could apply a narrowband impedance match at the inputs of the LTC6401-26 for frequency selection and/or noise reduction.
Referring to Figure 3, LTC6401-26 can be easily configured for single-ended input and differential output without a balun. The signal is fed to one of the inputs through a matching network while the other input is connected to the same matching network and a source resistor. Because the return ratios of the two feedback paths are equal, the two outputs have the same gain and thus symmetrical swing. In general, the single-ended input impedance and termination resistor $R_{T}$ are determined by the combination of $R_{S}, R_{G}$ and $R_{F}$ For example, when $R_{S}$ is $50 \Omega$, it is found that the single-ended input impedance is $75 \Omega$ and $R_{T}$ is $150 \Omega$ in order to match to a $50 \Omega$ source impedance.

Figure 1. Input Termination for Differential $50 \Omega$ Input Impedance

Figure 2. Input Termination for Differential $50 \Omega$ Input Impedance Using a Balun

APPLICATIONS INFORMATION

Figure 3. Input Termination for Single-Ended $50 \Omega$ Input Impedance

The LTC6401-26 is unconditionally stable, i.e. differential stability factor Kf>1 and stability measure B1>0. However, the overall differential gain is affected by both source impedance and load impedance as shown in Figure 4:

$$
A_{V}=\left|\frac{V_{O U T}}{V_{I N}}\right|=\frac{1000}{R_{S}+50} \cdot \frac{R_{L}}{25+R_{L}}
$$

The noise performance of the LTC6401-26 also depends upon the source impedance and termination. A trade-off between gain and noise is obvious when constant noise figure circle and constant gain circle are plotted within the same input Smith Chart, based on which users can choose the optimal source impedance for a given gain and noise requirement.

## Output Impedance Match and Filter

The LTC6401-26 can drive an ADC directly without external output impedance matching. Alternatively, the differential output impedance of $25 \Omega$ can be made larger, e.g. $50 \Omega$, by series resistors or LC network.

Figure 4. Calculate Differential Gain

The internal low pass filter outputs at +OUTF/-OUTF have a -3 dB bandwidth of 590 MHz . External capacitors can reduce the low pass filter bandwidth as shown in Figure 5. A bandpass filter is easily implemented with only a few components as shown in Figure 6. Three 39pF capacitors and 16 nH inductor create a bandpass filter with 165 MHz center frequency, -3 dB frequencies at 138 MHz and 200MHz.

## Output Common Mode Adjustment

The LTC6401-26's output common mode voltage is set by the $\mathrm{V}_{\text {OCM }}$ pin, which is a high impedance input. The output common mode voltage is capable of tracking $\mathrm{V}_{\text {OCM }}$ in a range from 1 V to 1.6 V . Bandwidth of $\mathrm{V}_{\text {Ocm }}$ control is typically 15 MHz , which is dominated by a low pass filter connected to the $\mathrm{V}_{0 c m}$ pin and is aimed to reduce common mode noise generation at the outputs. The internal common mode feedback loop has a -3dB bandwidth of 400 MHz , allowing fast rejection of any common mode output voltage disturbance. The $\mathrm{V}_{\text {OCM }}$ pin should be tied to a DC bias voltage with a $0.1 \mu \mathrm{~F}$ bypass capacitor. When interfacing with 3V A/D converters such as the LTC22xx families, the $\mathrm{V}_{0 \mathrm{CM}}$ pin can be connected to the $\mathrm{V}_{\mathrm{CM}}$ pin of the ADC.

## Driving A/D Converters

The LTC6401-26 has been specifically designed to interface directly with high speed A/D converters. Figure 7 shows the LTC6401-26 with single-ended input driving the LTC2208, which is a 16 -bit, 130 Msps ADC. Two external $5 \Omega$ resistors help eliminate potential resonance associated with bond wires of either the ADC input or the driver output. $V_{\text {OCM }}$

APPLICATIONS INFORMATION

Figure 6. LTC6401-26 with 165MHz Output Bandpass Filter
of the LTC6401-26 is connected to $\mathrm{V}_{\text {CM }}$ of the LTC2208 at 1.25 V . Alternatively, a single-ended input signal can be converted to a differential signal via a balun and fed to the input of the LTC6401-26. Figure 8 summarizes the IMD3 performance of the whole system as shown in Figure 7.

## Test Circuits

Due to the fully-differential design of the LTC6401 and its usefulness in applications with differing characteristic specifications, two test circuits are used to generate the information in this datasheet. Test Circuit A is DC987B, a two-port demonstration circuit for the LTC6401 family. The silkscreen is shown in Figure 9. This circuit includes input and output transformers (baluns) for single-ended-to-differential conversion and impedance transformation, allowing direct hook-up to a 2-port network analyzer. There are also series resistors at the output to present the LTC6401 with a $375 \Omega$ differential load, optimizing distortion performance. Due to the inputand outputtransformers, the -3 dB bandwidth is reduced from 1.6 GHz to 1.37 GHz .

Figure 7. Single-Ended Input to LTC6401-26 and LTC2208

Figure 8. $\mathrm{IMD}_{3}$ for the Combination of LTC6401-26 and LTC2208
Test Circuit B uses a 4-port network analyzer to measure S-parameters and gain/phase response. This removes the effects of the wideband baluns and associated circuitry, for a true picture of the $>1 \mathrm{GHz}$ S-parameters and AC characteristics.

## PACKAGE DESCRIPTION

## UD Package

16-Lead Plastic QFN (3mm $\times 3 \mathrm{~mm}$ )
(Reference LTC DWG \# 05-08-1691)

RECOMMENDED SOLDER PAD PITCH AND DIMENSIONS

BOTTOM VIEW—EXPOSED PAD

1. DRAWING CONFORMS TO JEDEC PACKAGE OUTLINE MO-220 VARIATION (WEED-2)
2. DRAWING NOT TO SCALE
3. ALL DIMENSIONS ARE IN MILLIMETERS
4. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE MOLD FLASH. MOLD FLASH, IF PRESENT, SHALL NOT EXCEED 0.15 mm ON ANY SIDE
5. EXPOSED PAD SHALL BE SOLDER PLATED
6. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION ON THE TOP AND BOTTOM OF PACKAGE
