Analog Semiconductor IC

High speed, Low dropout, $\pm 1\%$ High output accuracy with On/Off circuit CMOS Voltage Regulator

VRH Series

GENERAL DESCRIPTIONS

The VRH series are positive voltage regulators with high speed, low voltage dropout and high accuracy output achieved by low current consumption. The output voltage is guaranteed within $\pm 1\%$ within the given temperature range by Vref controlling the temperature characteristic. It corresponds to the low ESR capacitor as an output stabilization capacitor. The charged ESR capacitor can be discharged with an internal switch by making the EN=Vss, as a result the VOUT quickly returns to the Vss level. To make the current capacity of the output transistor not exceeded, the over-current protection circuit is built in.

FEATURES

- Output voltage range 0.9V~5.0V (selectable with a step of 0.05V)
- Operating voltage range 1.6V~6.0V
- High accuracy output voltage $\pm 1\%$ (VOUT=1.95V ~ 5.0V) / $\pm 20\text{mV}$ (VOUT=0.9V ~ 1.9V)
- Maximum output current 250mA
- Dropout voltage Typ. 90mV (output=3.0V, IOUT=100mA)
- Low current consumption Typ. 25 μA
- High ripple rejection Typ. 75dB at 1KHz
- Low ESR capacitor 1.0 μF ceramic capacitor
- Operating temperature range -40°C ~ $+85^{\circ}\text{C}$
- Built-in over-current protector Limit current : 300mA
- CL high-speed auto-discharge
- Built-in On/Off circuit
- Small package SOT-25 (2.9 \times 2.8 \times 1.1mm), LLP-4 (1.2 \times 1.6 \times 0.6mm), SDFN-4 (1.0 \times 1.0 \times 0.4mm),

APPLICATIONS

- Battery powered devices
- Cellular phone
- Digital / Video cameras
- Portable games
- Handheld instruments

PRODUCTS NUMBERING GUIDE

PIN CONFIGURATION / MARKING SPECIFICATION (SOT-25)

(Top view)

● **Pin Configuration**

No.	Symbol	Descriptions
1	VIN	Voltage input
2	VSS	Power ground
3	EN	Chip enable
4	NC	Non connection (open)
5	VOUT	Output

● **Marking Specification**

Code	Mark	Contents
A	H	Products series name
BCD	090~500	Output voltage
E	X	Discharge function
F	Internal rule	Lot number

EN low level voltage	V _{ENL}		-	-	0.3	V	4
EN high level current	I _{ENH}	V _{EN} = V _{IN} =5V	0.25	-	5.0	μ A	4
EN low level current	I _{ENL}	V _{EN} = V _{SS}	-0.1	-	0.1	μ A	4
CL auto-discharge resistance	R _{DIS}	V _{IN} =6.0V, V _{OUT} =4.0V, V _{EN} = V _{SS}	-	160	-	Ω	1

TEST CIRCUITS

- **Circuit (1)** - Output voltage, Output current, Dropout voltage, Input voltage, Load regulation, Line regulation, Limit current, Short circuit current, Output voltage temperature coefficient, CL auto-discharge resistance

- **Circuit (2)** - Current consumption, Standby current

- **Circuit (3)** - Ripple rejection

- **Circuit (4)** - EN high level voltage, EN low level voltage, EN high level current, EN low level current

DESCRIPTION OF OPERATION

● General operation

In reference to following block diagram of the VRH series ;

By the error amplifier, the reference voltage (V_{REF}) is compared with $V_{FEEDBACK}$ which is divided by feedback resistors R_1 and R_2 . It supplies the output transistor (see note *1) to keep a stabilized output voltage against with any fluctuation of input voltage by negative feedback system.

Note *1)

The VRH series has P-channel MOSFET which is connected to the VOUT terminal as the output transistor. To prevent the VRH series from being damaged due to inverse current from VOUT terminal to VIN terminal through a parasitic diode, VOUT should not be exceeded $V_{IN}+0.3V$.

● EN terminal (shutdown function) & CL auto-discharge

The VRH series can be shutdown through EN terminal. The P-channel MOSFET is turned off and operation of all internal circuits stops to reduce the current consumption when the signal of EN terminal is set to the shutdown level. In shutdown mode, the VRH series enables the electric charge at the CL to be discharged via the auto-discharge resistance (R_{DIS} ; 160 Ω), and the VOUT terminal can be rapidly returned to the VSS level as a result.

● Output capacitor (CL)

For phase compensation, an output capacitor (C_L) is required to connected between VOUT terminal and VSS terminal as close as possible. A ceramic capacitor with capacitance value of at least 1.0 μF is recommended. Of course, the suitable capacitance value should be different by the condition of each application. In addition, an input capacitor (C_{IN}) with capacitance value of at least 1.0 μF is also recommended between VIN terminal and VSS terminal for stable input power.

● Over current protection and short circuit protection

Built-in over current protection circuit performs circuit protection from over current as a current limiter. When the load current reaches the limit level, the output voltage drops and output current also decreases accordingly. A current of typ. 40mA will flow when output terminal is shorted.
