Terminal Type and Long Sensing Distance Type

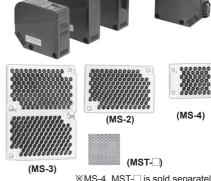

Features

- Sensitivity adjuster
- Timer function: ON Delay, OFF Delay, One-shot Delay
- NPN/PNP open collector output (DC power type)
- Self-diagnosis function (green LED turns on in stable level)
- Wide power supply range: Universal 24-240VDC/24-240VAC
- Protection structure IP66 (IEC standard)

Specifications

Mounting and Sensitivity Adjustment

Through-beam type

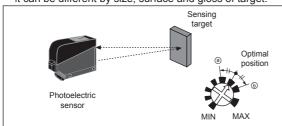

- 1. Supply the power to the photoelectric sensor, after setting the emitter and the receiver facing each other.
- 2. Set the receiver in center of position in the middle of the operation range of indicator by adjusting the receiver or the emitter right and left, up and down.
- 3. After the adjustment, check the stability of operation by putting the object at the optical axis.
- XIf the sensing target is translucent body or smaller than Ø15mm, it can be missed by sensor because light
- XSensitivity adjustment: Refer to the diffuse reflective type's.

A-67 **Autonics**

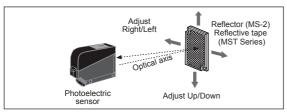

O Diffuse reflective type

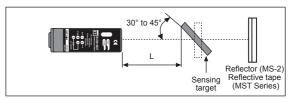

- The sensitivity should be adjusted depending on a sensing target or mounting place.
- Set the sensing target at a position to be sensed by the beam, then turn the sensitivity adjuster from the min. position of the sensitivity adjuster to the position @ where the operation indicator (yellow LED) turns ON. (The self-diagnosis indicator (green LED) is in OFF status.)
- 3. The operation indicator turns OFF, when the sensing target is removed from the position (a). Without the sensing target, turn the sensitivity adjuster from the position (a) to position (b) where the operation indicator (yellow LED) turns ON. (If the operation indicator does not turn ON, max. position of the sensitivity adjuster is (b).)
- Set the sensitivity adjuster at the center of two switching position (a), (b).
- ※Above sensitivity adjustment is for Light ON mode. If it is for Dark ON mode, operation indicator (yellow LED) operates opposite.
- %The sensing distance indicated on specification chart is for 200×200mm of non-glossy white paper. Be sure that it can be different by size, surface and gloss of target.

Retroreflective type

- Supply the power to the photoelectric sensor, after setting the photoelectric sensor and the reflector or reflective tape face to face.
- Set the photoelectric sensor in the position which indicator turns on, by adjusting the reflector (or reflective tape) or the sensor right and left, up and down.
- Fix both units tightly after checking that the unit detects the target.
- XIf using more than 2 photoelectric sensors in parallel, the space among them should be more than 30cm.
- XIf reflectance of target is higher than non-glossy white paper, it might cause malfunction by reflection from the target when the target is near to photoelectric sensor. Therefore put enough space between the target and the photoelectric sensor or the surface of the target should be installed at angle of 30° to 45° against optical axis. (When a sensing target with high reflectance near by, photoelectric sensing with the polarizing filter should be used.)
- X Sensitivity adjustment: Refer to the diffuse reflective type's.

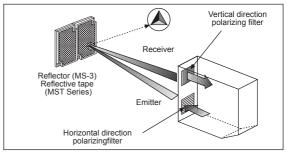

- XIf the mounting place is too narrow, please use MS-4 instead of MS-2.
- ※Please use reflective tape (MST Series) for where a reflector is not installed.

© Retroreflective type (Built-in polarizing filter)

The light passed through the polarizing filter of the emitter reaches to the MS-3 reflector or reflective tape converting as horizontal direction. It reaches to the receiver element of polarizing filter converting as vertical by the MS-3 reflector or reflective tape. Therefore, this type can also detect reflective mirror.

※Please use reflective tape (MST Series) for where a reflector is not installed.

Reflectivity by Reflective Tape Model

Model	Standard	Built-in polarizing filter
MST-50-10 (50×50mm)	90%	30%
MST-100-5 (100×100mm)	100%	40%
MST-200-2 (200×200mm)	110%	60%

- XThis reflectivity is based on the reflector (MS-2).
- ※Reflectivity may vary depending on usage environment and installation conditions.

The sensing distance and minimum sensing target size increase as the size of the tape increases.

Please check the reflectivity before using reflective tapes.

※For using reflective tape, installation distance should be min. 20mm.
