# IQS253 Datasheet - Configurable 3 Channel DYCAL ${ }^{T M}$ Capacitive Sensor with Automatic Compensation for Sensitivity Reducing Objects 

## Unparallelled Features:

$\square$ DYCAL ${ }^{T M}$ : Intelligent Hysteresis
$\square$ Internal Capacitor Implementation (ICI) - Reference capacitor on-chip
$\square$ Automatic Tuning Implementation (ATI) - Automatic adjustment for optimal sensor performance
The IQS253 ProxSense ${ }^{\circledR}$ IC is a fully integrated capacitive sensor implementing Dynamic Calibration (DYCAL ${ }^{T M}$ ) technology: intelligent hysteresis to allow for sensor drift even during sensor activation.

## Main features:

$\square$ Self or Projected Technology sensors
$\square 3$ Channels configurable as DYCAL ${ }^{T M} /$ Normal output
$\square$ Self: Boolean direct output configurable through $I^{2} \mathrm{C}$
$\square$ Supply voltage: 1.8 V to 3.6 V
Internal voltage regulator
$\square$ Advanced on-chip digital signal processing

$\square I^{2} \mathrm{C}$ adjustable settings

- DYCAL ${ }^{T M}$ settings
- Control over filter operation
- Time-out for stuck key
- Proximity and Touch sensitivity selections
- Low Power options
- Event Mode possible (only communicates if an event is detected)

Applications:
$\square$ Occupancy sensors
$\square$ SAR Compliant sensors for Tablet PCs
On-ear detection for mobile phones
$\square$ 3D glasses
$\square$ Personal Media Players
$\square$ Remote Control Sleep implementation
Gaming Controllers
$\square$ Any applications where a touch and proximity condition can exist for a extended period of time

## Advantages:

$\square$ Allows for sensor drift in periods of activation and non-activation

Improved digital filtering to reduce external noise
$\square$ Highly adjustable $I^{2} \mathrm{C}$ device which only interrupts (Event Mode) when an event is detected
$\square$ Proximity activated back lighting

## 1 Functional Overview

The IQS253 is a fully integrated three channel capacitive sensor implementing the DYCAL ${ }^{T M}$ functionality. Dynamic Calibration (DYCAL ${ }^{T M}$ ) is an intelligent hysteresis to allow for sensor drift even during sensor activation. All channels can be either configured as a DYCAL ${ }^{T M}$ channel or as a normal direct output channel. The device has an internal voltage regulator and reference capacitor. The regulator is used as reference for the charge transfer circuitry. Both circuits reduce the external component count needed. The device automatically tracks slow varying environmental changes via various signal processing algorithms and has an Automatic Tuning (ATI) algorithm to calibrate the device to the sense electrode. The charge transfer method of capacitive sensing is employed on the IQS253. (The charge transfer principle is thoroughly described in the application note: "AZD004 - Azoteq Capacitive Sensing".) The IQS253 can be configured as either a self capacitance sensor, where it has a Boolean output pin available. With the sensor configured as a projected capacitance sensor, this pin is configured as the transmitter electrode. DYCAL ${ }^{T M}$ settings are highly configurable via $I^{2} C$. These settings include:

- DYCAL ${ }^{T M}$ activation with either Touch or Proximity detection
- Release threshold

Touch mode (TM) entry speed
Downward filter adaptation rate when in TM

- Upward filter adaptation rate when in TM
. ATI block after exiting activation
- Boolean output configuration

The above mentioned configuration settings do not include regular ProxSense ${ }^{\circledR}$ settings adjustable via $I^{2} \mathrm{C}$. Regular settings include:

[^0]
## Noise detection activation

ATI setup (control over sensitivity and when ATI should occur)

- Redo ATI

Control over the LTA filters
$\square$ WDT enable / disable

- AC Filter enable / disable

Proximity debounce
$\square$ Charge transfer frequency
Block channel
$\square$ Event mode enable / disable
Setup to wake communication with a particular event

### 1.1 Applicability

All specifications, except where specifically mentioned otherwise, provided by this datasheet are applicable to the following ranges:

- Temperature $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

Supply voltage (VDDHI) 1.8 V to 3.3 V

## 2 Analogue Functionality

The analogue circuitry measures the capacitance of the sense electrodes attached to the Cx pins through a charge transfer process that is periodically initiated by the digital circuitry. The measuring process is referred to as a conversion and consists of the discharging of Cs and Cx , the charging of Cx and then a series of charge transfers from Cx to Cs until a trip voltage is reached. The number of charge transfers required to reach the trip voltage is referred to as counts (Cs). The capacitance measurement circuitry makes use of an internal reference capacitor and voltage reference (VREG). The analogue circuitry further provides functionality for:
$\square$ Power on reset (POR) detection.
$\square$ Brown out detection (BOD).

## 3 Digital Functionality

The digital processing functionality is responsible for:

Management of BOD and WDT events.
$\square$ Initiation of conversions at the selected rate.
$\square$ Processing of CS and execution of algorithms.
$\square$ Monitoring and automatic execution of the ATI algorithm.
$\square$ Signal processing and digital filtering.
$\square$ Detection of PROX and TOUCH events.
Managing outputs of the device.
$\square$ Managing serial communications.
$\square$ Manage programming of OTP options.

## 4 Packaging and Pin-Out

The IQS253 and IQS253A ICs are available in a MSOP-10 package. The pin-outs of the self and projected setup differ with the transmitter (CTX) on the projected configuration being configured as a Boolean output (B_OUT) on the self configuration.

Figure 4.1: IQS253 Pin Out.

### 4.1 IQS253 Self Capacitance

### 4.1.1 Pin-out

Table 4.1: IQS253 Self Capacitive Pin-out

| Pin | Name | Type | Function |
| :---: | :---: | :---: | :---: |
| 1 | GND | Supply Input | Ground Reference |
| 2 | CX0 | Analogue | Sense Electrode 0 |
| 3 | CX1 | Analogue | Sense Electrode 1 |
| 4 | VDDHI | Supply Input | Supply Voltage Input |
| 5 | VREG | Analogue Output | Internal Regulator Pin (Connect $1 \mu$ F bypass capacitor) |
| 6 | RDY/ND | Digital Out / Analogue In | I $^{2}$ C: RDY Data indication Output / ND pin |
| 7 | SDA | Digital I/O | I $^{2}$ C: Data Input / Output |

### 4.2 IQS253 Projected

Table 4.2: IQS253 Projected Capacitive Pin-out

| Pin | Name | Type | Function |
| :---: | :---: | :---: | :---: |
| 1 | GND | Supply Input | Ground Reference |
| 2 | CX0 | Analogue | Projected Charge Receiver 0 |
| 3 | CX1 | Analogue | Projected Charge Receiver 1 |
| 4 | VDDHI | Supply Input | Supply Voltage Input |
| 5 | VREG | Analogue Output | Internal Regulator Pin (Connect $1 \mu$ F bypass capacitor) |
| 6 | RDY/ND | Digital Out / Analogue In | I $^{2}$ C: RDY Data indication Output / ND pin |
| 7 | SDA | Digital I/O | I $^{2} \mathrm{C}:$ Data Input / Output |
| 8 | SCL | Digital Input | I $^{2}$ C: Clock Input |
| 9 | CX2 | Analogue | Projected Charge Receiver 2 |
| 10 | CTX | Analogue | Charge Transmitter |

Figure 4.3: Typical application schematic of IQS253 projected capacitive configuration. Refer to the application note for layout guideline AZD008

### 4.3 Power Supply and PCB Layout

Azoteq IC's provide a high level of on-chip hardware and software noise filtering and ESD protection (refer to Section 12). Designing PCB's with better noise immunity against EMI, FTB and ESD in mind, it is always advisable to keep the critical noise suppression components like the de-coupling capacitors and series resistors in Figure 4.2 as close as possible to the IC. Always maintain a good ground connection and ground pour underneath the IC. For more guidelines please refer to the relevant application notes as mentioned in Section 4.4. Where a system level ESD strike is found to cause the IC to go into ESD induced latch-up, it is suggested that the supply current to the IQS263 IC is limited by means of a series resistor that could limit the maximum supply current to the IC to $<80 \mathrm{~mA}$.

### 4.4 Design Rules for Harsh EMC Environments

Figure 4.4: EMC Design Choices. Applicable application notes: AZD013, AZD015, AZD051, AZD052.

## 5 DYCAL

Figure 5.1: DYCAL Overview.

### 5.1 Operating Principle

Figure 5.1 is a visual representation of the DYCAL ${ }^{T M}$ functionality. The DYCAL output is used to indicate the status of a DYCAL ${ }^{T M}$ event (both a proximity and a touch event). The DYCAL ${ }^{T M}$ functionality is summarised below.

## Non-Touch Mode

The DYCAL output is activated on the successful detection of a proximity event and will remain activated for the duration of the proximity event, permitting that this event is not longer than the filter halt timings. The LTA will be halted in this time. As soon as a touch condition is detected (CS below $\mathrm{T}_{\text {THR }}$ ), the controller will dynamically re-calibrate its LTA to the halted LTA - $\mathrm{T}_{\text {THR }}$. The IC is now in Touch Mode (TM).

## Touch Mode

After the re-calibration of the LTA, it will follow the CS and be allowed to track slow varying environmental changes. If the CS were to exceed the LTA by a release threshold (REL_T $\mathrm{T}_{\text {THR }}$ ) the touch detection will stop and the DYCAL output will return to its original state.

## 6 ProxSense Module

The IQS253 contains a ProxSense ${ }^{\circledR}$ module that uses patented technology to provide detection of PROX/TOUCH on numerous sensing lines. The ProxSense ${ }^{\circledR}$ module is a combination of hardware and software, based on the principles of charge transfer. A measurement is taken and used for calculating appropriate outputs.

### 6.1 Charge Transfer Concepts

Capacitance measurements are taken with a charge transfer process that is periodically initiated. Self capacitive sensing measures the capacitance between the sense electrode (Cx) relative to ground. Projected capacitance sensing measures the capacitance between 2 electrodes referred to as the transmitter (CTX) and receiver (CRX). The measuring process is referred to as a charge transfer cycle and consists of the following:

Discharging of an internal sampling capacitor (Cs) and the electrode capacitors (self: Cx or projected: CTX \& CRX) on a channel.

- charging of Cx's / CTX's connected to the channel
and then a series of charge transfers from the Cx's / CRX's to the internal sampling capacitors (Cs), until the trip voltage is reached.

The number of charge transfers required to reach the trip voltage on a channel is referred to as Counts (CS). The device continuously repeats charge transfers on the sense electrode connected to the Cx pin. For each channel a Long Term Average (LTA) is calculated (12 bit unsigned integer values). The counts (12 bit unsigned integer values) are processed and compared to the LTA to detect DYCAL, TOUCH and PROX events. For more information regarding capacitive sensing, refer to the application note "AZD004 - Azoteq Capacitive Sensing". Please note: Attaching a probe to the

CX/CTX/CRX pin will influence the capacitance of the sense electrodes and therefore
CS. This will have an immediate influence on
CS.

## 7 Prox Module Setup

### 7.1 Self or Projected Capacitance

The IC can be used in either self or projected capacitance mode. The IC is default in self capacitance mode. This can be changed to projected capacitance mode through either a FG (one time programmable option) bit or in the first communication window with start-up (use the setup window to set the IC to Projected mode). The user should set the PROJ bit (bit 7) in the PROX_SETTINGS1 [0xD2H] register (refer to the Device Settings the Memory Map, available in Appendix B) to enable projected capacitance technology. The technology enabled on the IC will be reported in the SYSFLAGS [ $0 \times 10 \mathrm{H}$ ] register. Refer to the IQS253 communication interface application note for more details on the 'Setup Window'. This setting can only be sent to the IQS253 in the setup-communicationwindow. Please see the Section 9.1 for more information regarding this. Note that this SetupWindow is only available once after power-ON.

The IQS253 will always start-up in Event Mode (default after POR). Thus, after the initial Setup-Window, there will only be communication windows available upon Events (ATI, proximity, etc. Refer to the Event_Mask [0xD9H] register). Therefore, if the device is not set to continuous streaming mode (bit 2 in the PROX_SETTINGS2 [0xD3H] register) during the Setup-Window, the master controller will have to pull the RDY line low to force a communication window to setup additional settings. Please refer to application note AZD062 for
guidelines on setting up the IQS253.
When using more than one IQS253 device on the same $I^{2} \mathrm{C}$ bus (especially when sharing a input pin on the master for the RDY lines), it is recommended to use the FG options to set the sensing technology (Self OR Projected) and the individual sub-addresses.

### 7.2 Rate of Charge Cycles

### 7.2.1 Boost Power rate

With all 3 channels active and the IQS253 in Boost Power (BP) mode, the Counts (CS) are charged at a fixed sampling frequency (fsAMPLE) per channel. This is done to ensure regular samples for processing of results. It is calculated as each channel having a time ( $\mathrm{t}_{\text {CHANNEL }}=$ charge period ( $\left.\mathrm{t}_{\text {CHARGE }}\right)+$ computation time) of 9 ms , thus the time between consecutive samples on a channel ( $\mathrm{t}_{\text {SAMPLE }}$ ) will optimally be 27 ms (or 37 Hz ).

Figure 7.1: Boost power as on CX / CRXx.

For every channel disabled, the sampling rate on a channel will reduce with approximately 9 ms .

### 7.2.2 Low Power Rates

Low current consumption charging modes are available. In any Low Power (LP) mode, there will be a $t_{L P}$ low power time applicable. This is determined by the LOW_POWER register.

The value written into this register multiplied by 16 ms will yield the LP time ( $\mathrm{t}_{L P}$ ). Please note that this time is only applicable from value 03 H and higher loaded into the LOW_POWER register. The values 01 H and 02 H will have a different time. See Table 12.6 for all timings. With the detection of an undebounced proximity event the IC will zoom to BP mode, allowing a very fast reaction time for further possible DYCAL /touch /proximity events. All active channels will be consecutively charged every $\mathrm{T}_{L P}$. This succession of charge cycles are succeeded by the charging of CX2 /CRX2 as a dummy charge cycle. If a LP rate is selected through register LOW_POWER and charging is not in the zoomed in state (BP mode), the LP bit (SYSFLAGS register) will be set.

When using low power mode, the designer must ensure that the voltage drop on VREG is not larger than 50 mV . It is suggested to increase the VREG capacitor to at least $4.7 \mu \mathrm{~F}$ when using low power.

### 7.2.3 Halt Charge (HC)

Setting the HC bit will immediately cause the IC to stop doing conversions (stop measuring capacitance), set the RDY line as an input and enter a sleep mode. To wake up the IQS253, and let it continue with conversions, the RDY line should be pulled low for at least 2.5 ms . The RDY line should thereafter be monitored again for communication windows. The HC bit in the memory map will automatically be cleared.

Figure 7.2: Charge cycles as charged in LP modes.

### 7.3 Report Rate

The report rate of the device depends on the charge transfer frequency, the number of channels enabled and the length of communications performed by the master device.

### 7.4 Active Channels

The user has the option to disable channels. This can be done in the ACTIVE_CHAN register. All 3 channels are enabled by default.

### 7.5 DYCAL ${ }^{T M}$ or Direct Output

Each channel can be configured to either give a DYCAL ${ }^{T M}$ (default) or a direct-output through the DYCAL_CHANS register. Configuring a channel as a direct-output channel will yield that the touch and prox indication bits will actively indicate whether a channel detects either of these events. The DYCAL ${ }^{T M}$ function will not be applied to direct-channels and any combination of DYCAL ${ }^{T M}$ or direct-output channels can be used.

### 7.6 Report Order (Channel Numbers)

The data is reported in the sequence; Ch0, Ch1, Ch2, Ch0, Ch1, Ch2, Ch0, etc. The chan-
nel number (CHAN_NUM) is used to indicate to which channel the rest of the data in the dataset belongs.

### 7.7 Transfer Frequency $\left(f_{c x}\right)$

The frequency of the charge transfers can be selected adjusting the XFER_FREQx bits. An optimal transfer frequency must be selected for a specific application.

### 7.8 Counts

Capacitive measurements are available in these registers. The data has an AC noise filter applied, which helps the device to work in very noisy environments. The filter is default enabled.

### 7.8.1 Disabling AC Noise Filter

The AC noise filter can be disabled by setting bit ACF_DISABLE in the PROX_SETTINGS2 register. This will increase response times, at the expense of noise immunity.

### 7.9 Long Term Average (LTA)

The LTA filter can be seen as the baseline or reference value. The LTA is calculated to continuously adapt to any environmental drift. The LTA filter is calculated from the CS value for each channel. The LTA filter allows the device to adapt to environmental (slow moving) drift. Actuation (DYCAL, Touch or Prox) decisions are made by comparing the CS value with the LTA reference value. The 12bit LTA value is contained in the LTA_H and LTA_L registers.

### 7.9.1 Filter Adaptation Rates

The LTA will adapt with different rates depending in which state the IC is in. Calculating a new LTA value is a function of the old LTA and
the newly measured CS. The percentage of CS used in this LTA calculation is specified as the filter adaptation rate. 100\% specifies that there are no filtering and LTA = CS. A lower percentage value for the adaptation rate will yield a slower adaptation rate. The IQS253 contains 3 user adjustable adaptation rates.

Filter adaptation rate in non-TM
The LTA filter will adapt according to the LTA_ADAPT rate if the IQS253 is in non-TM and no proximity event is detected. See Figure 5.1 for a visual representation.

## Filter adaptation rate in TM

The LTA will adapt according to the LTA_ADAPT_IN rate if IC is IN Touch Mode (TM) and the LTA is adjusting towards CS. This rate will apply until LTA has reached CS. See Figure 5.1 for a visual representation.

Filter Halt in non-TM if |LTA-CS| > 16
The LTA will adapt according to the LTA_ADAPT_OUT rate if IC is in Touch Mode (TM), has reached the CS and
$\square$ Self: CS < LTA + 16

Projected: CS > LTA - 16

This is the rate at which LTA adapts before CS is on its way OUT of TM. See Figure 5.1 for a visual representation.

### 7.9.2 Filter Reseed

Setting the RESEED bit in the PROX_SETTINGS0 register, will reseed LTA to:

Self: 8 above CS
$\square$ Projected: 8 below CS

The IC will stay in the state in which it was before the command was issued. Thus, either non-TM or TM. The bit will automatically be cleared by the IC as soon as the command has been executed.

### 7.9.3 Filter Halting

LTA halt status The status of currently halted channels is displayed in this byte. With the IC in non-TM, it will only show that a channel is halted if it detected a proximity condition. Once a touch is detected the halting bit for that channel will be cleared. With the IC in TM, it will show halting bits of channels where:

Self: CS > LTA + 16 Projected: CS < LTA

## - 16 Force halt

Setting the FORCE_HALT bit will cause all LTA values to stop adapting to CS. This bit should be cleared for the IC to start adapting to the environment again. If the FORCE_HALT command was issued while a channel was in non-TM and a touch is made on that channel, it will cause the LTA to stay halted but decrease with the Touch Threshold for that channel.

Automatic LTA halting in non-TM
With the IC in non-TM, a proximity event will cause halting of the LTA. The halting options are:

IQ Switch ${ }^{\oplus}$
ProxSense ${ }^{\circledR}$ Series

Table 7.1: LTA halting in non-TM.

| HALT1:HALTO | $\mathbf{t}_{H A L T}$ | Filter |
| :---: | :---: | :---: |
| $\mathbf{0}$ | Short (default) | During PROX, filter halts for 20s, then reseeds |
| 1 | Long | During PROX, filter halts for 40s, then reseeds |
| 10 | Never | Filter NEVER halts |
| 11 | Always | Filter is ALWAYS halted during a PROX detection |

The halt times given in Table 7.1 will be extended when disabling channels. If the halt times in Table 7.1 are required while using less than 3 channels, the reseed command should be used from the master device. This only applies to IQS253 and not IQS253A. The halt times given in Table 7.1 will stay fixed when disabling channels on the IQS253A.

Automatic LTA halting in TM
With the IC in TM and LTA within 16 counts of CS, no halting will occur. Halting will occur once:

- Self: LTA + Release threshold < CS > LTA + 16

DProjected: LTA - Release Threshold < CS < LTA - 16

ALWAYS_HALT_DYCAL $=0$ : The LTA will halt with the same conditions as stated in Table 7.1.

ALWAYS_HALT_DYCAL $=1$ : The LTA will always halt if above conditions apply.

The ALWAYS_HALT_DYCAL bit gives the designer more freedom, allowing different halting conditions for when the IC is in non-TM and in TM.

### 7.10 Determine Touch or Prox

An event is determined by comparing the CS with the LTA. Since the CS reacts differently when comparing the self with the projected capacitance technology, the user should consider only the conditions for the technology used.

ISelf: CS < LTA - Threshold
-PProjected: CS > LTA + Threshold
Threshold can be either a Proximity or Touch threshold.

### 7.10.1 Proximity

## Thresholds:

Proximity thresholds can be adjusted individually for each channel and can be any integer values between 1 and 254 .
Status:
The proximity status of the channels are indicated in the PROX register. The indication bits in this register should only be used if the applicable channel is configured into direct mode, otherwise the DYCAL status bits should be considered.
Debouncing:
By default, 6 consecutive samples should satisfy a proximity detection condition. This debounce can be adjusted to 4 through the PROX_DEBOUNCE bit in the PROX_SETTINGS3 register.

### 7.10.2 Touch Threshold and Status

Touch thresholds can be adjusted individually for each channel and are calculated as a function of the LTA.

TouchThreshold $=($ value $/ 256 *$ LTA $)$
where value can be any integer value between 1 and 254.

The proximity status of the channels are indicated in the TOUCH register. (The indication bits in this register should only be used if the applicable channel is configured into direct mode, otherwise the DYCAL status bits should be considered)

### 7.11 ATI

The Auto Tuning Implementation (ATI) is a sophisticated technology implemented in

ProxSense ${ }^{\circledR}$ devices. It allows optimal performance of the devices for a wide range of sensing electrode capacitances, without modification or addition of external components. The ATI allows the tuning of two parameters, an ATI Multiplier and an ATI Compensation, to adjust the sample value for an attached sensing electrode. ATI allows the designer to optimise a specific design by adjusting the sensitivity and stability of each channel through the adjustment of the ATI parameters. Partial ATI lets the designer specify the MULTPLIER parameters instead of an actual base value.See Section 7.11.3. The IQS253 has an automated ATI function. The auto-ATI function is by default enabled, but can be disabled by setting the ATI_OFF bit. The ATI bit in the SYSFLAGS register will be set while an ATI event is busy.

### 7.11.1 ATI Sensitivity

The designer can specify the BASE values for each channel and a global TARGET value for all channels. A rough estimation of sensitivity can be calculated as:

$$
\begin{equation*}
\text { Sensitivity }=\text { TARGET } / \text { BASE } \tag{7.2}
\end{equation*}
$$

As can be seen from this equation, the sensitivity can be increased by either increasing the TARGET or decreasing the BASE value. It should, however, be noted that a higher sensitivity will yield a higher noise susceptibility.

### 7.11.2 ATI Target

The target is reached by adjusting the COMPENSATION bits for each channel. The target value is written into the ATI_TARGET register. The value written into this register ( 0 to 255) multiplied by 8 will yield the new target value.

### 7.11.3 ATI Base (MULTIPLIER)

The following parameters will influence the base value:

- CS_SIZE : Size of sampling capacitor.
- PROJ_BIAS bits: Adjusts the biasing of some analogue parameters in the pro-
jected IC. (Only applicable in projected mode.)
$\square$ MULTIPLIER bits.
The base value used for the ATI function can be implemented in 2 ways:

1. ATI_PARTIAL $=0$. ATI automatically adjusts MULTIPLIER bits to reach a selected base value. Base values are available in the CHx_ATI_BASE registers. By using the ALT_BASE bit, an extended list of base values are available.
2. ATI_PARTIAL = 1. The designer can specify the multiplier settings. These settings will give a custom base value from where the compensation bits will be automatically implemented to reach the required target value. The base value is determined by two sets of multiplier bits.
Sensitivity Multipliers which will also scale the compensation to normalise the sensitivity and Compensation Multipliers to adjust the gain. Refer to the Memory Map were the multipliers bits can be set in registers CH0_ATI_BASE (0xC8) to CH2_ATI_BASE (0xCA).

### 7.11.4 Re-ATI

An automatic re-ATI event will occur if the CS is outside its re-ATI limits. The re-ATI limit is calculated as the target value divided by 8 . For example: Target $=1024 \mathrm{Re}$-ATI will occur if CS is outside $1024 \pm 128$. A re-ATI event can also be issued by the master by setting the REDO_ATI bit. It will clear automatically after the ATI event was started.

## 8 DYCAL ${ }^{T M}$

The DYCAL ${ }^{T M}$ technique is explained in Section 5. DYCAL ${ }^{T M}$ detections are displayed in the DYCAL_OUT register. The IQS253 will also
display whether each channel is in TM in the DYCAL_TM register. Important factors to consider when designing the DYCAL ${ }^{T M}$ functionality are:

### 8.1 DYCAL ${ }^{T M}$ channels enable

 Explained in Section 7.5.
### 8.2 DYCAL $^{T M}$ on TOUCH/PROX

The DYCAL ${ }^{T M}$ output bits can either be indicated when a proximity (default) or touch is detected by configuring the OUTPUT_ON_TOUCH bit.

### 8.3 LTA Adapt rates (IN and OUT)

Explained in Section 7.9.1.

### 8.4 Block Channel

A Touch on channel 1 can be used to block (and clear) the other channels' outputs. This is useful in Event Mode as the MCU can remain uninterrupted from the IQS253 while a touch is present on CH 1 .

```
\(\square\) DYCAL_OUT if a channel is in DYCAL \({ }^{T M}\) mode
```

$\square$ TOUCH if a channel is in direct-output mode
by setting bit BLOCK_ON_CH1_ENABLE. It should be noted that, if another channel had a DYCAL ${ }^{T M}$ detection and channel 1 detects a touch event, it will clear the other channels' DYCAL ${ }^{T M}$ outputs

### 8.5 DYCAL $^{T M}$ Release Threshold

The release threshold is relevant for when a channel is released after it was in TM. It is dependent on the selected touch
threshold and the setting chosen with bits REL_THR1:REL_THRO. (NOTE: the touch threshold can either be the user selected touch threshold or the dynamic touch threshold, whichever is larger)

## Example:

Technology: Self Capacitive
LTA $_{N T M}=1024$ (IC in NTM, before detection)
LTA $_{T M}=850$ (IC in TM, after detection)
Touch $_{\text {THR }}=$ LTA $_{N T M}{ }^{*} 30 / 256$
$\mathrm{Rel}_{T H R}=75 \%$ * Touch $_{\text {THR }}$

## Answer:

$\square$ The IQS253 detects a touch condition if: CS $<$ LTA $_{N T M}$ - Touch $_{T H R}$, where Touch ${ }_{T H R}$ $=1024 * 30 / 256=120$. Thus if CS goes below $1024-120=904$. Channel is in TM.
$\square$ The IC will exit TM and clear the DYCAL_OUT bit if:
CS $>$ LTA $_{T M}+0.75^{*} 120$ Thus if CS exceeds $850+90=940$ IC will exit TM and clear DYCAL_OUT.

### 8.6 DYCAL ${ }^{T M}$ dynamic touch threshold

The IQS253 calculates a dynamic touch threshold. This dynamic threshold enables the IC to calculate more accurately when a user releases a button. The LTA will reseed to [LTA Touch ${ }_{T H R}$ ] once a touch is made. Using self capacitance as example; the CS will probably go much lower than the value to which the LTA reseeded. The IQS253 will only calculate the dynamic touch threshold once the LTA is within 16 counts of the CS.

### 8.7 10s_ATI_BLOCK

After a touch is released and the LTA is reseeded towards the CS, it is highly probable that the LTA will be outside the re-ATI boundaries of the IC. This feature helps the channels
to block the re-ATI function for 10 seconds after an actuation has been released. It is also applicable if a channel is configured in directoutput mode. The 10seconds block of re-ATI after an actuation can be disabled by setting the 10s_ATI_BLOCK bit.

### 8.8 250ms_DELAY_TM ( $\left.\mathbf{t}_{D Y C A L}\right)$

By default, the LTA will only reseed to [LTA Touch $_{T H R}$ ] after $\mathrm{t}_{D Y C A L}$, when entering TM. An option exists to disable this delay, thus the LTA will reseed to [LTA - TouchThr] immediately with the detection of a touch.

### 8.9 Turbo Mode

The channels are charged in sequence and have a fixed period. By setting the Turbo_Mode bit, this period will be shortened to the fastest possible period, negating any dead-time. The AC filter will also be disabled for transfers to complete as fast as possible. If DYCAL is enabled, the Turbo Mode bit will also allow the IC to enter Touch Mode as fast as possible upon an event.

## 9 Communication

The IQS253 can communicate on the $I^{2} \mathrm{C}$ compatible bus structure. It uses the 2 wire serial interface bus which is $\mathrm{I}^{2} \mathrm{C}$ compatible and an optional RDY pin is available which indicates the communication window. The IQS253 has four available sub addresses, 44 H (default) to 47 H that is selected upon purchase of the IC. The maximum $I^{2} \mathrm{C}$ compatible communication speed for the IQS253 is 400kbit/s. Please refer to AZD062 - IQS253 Communication Interface Guidelines [? ] and the Memory Map in Appendix B for more details.

### 9.1 IC Setup Window

The IQS253 has a 'Setup Window' in which the user has the option to write some start-up settings before any conversions are done. For example, the 'Setup Window' can be used to change the IC from Self (default) to Projected sensing mode.

Figure 9.1: IC Setup Window.
$\mathrm{T}_{\text {START_UP }}$ after VDDHI was powered, RDY will go low for this 'Setup Window'. After addressing the IC, the required settings should be updated and only thereafter should a STOP bit be issued. The IC will then start with its conversions. If the 'Setup Window' is not serviced within $\mathrm{t}_{\mathrm{COMMS}}$, the RDY will go HIGH again (according to Section 9.3.3). Most settings can be updated at any time on the IC, except switching between Self and Projected capacitance technology, which can only be done in the 'Setup Window'. This setting can also be configured with a FG which would then not require setting up this function via $I^{2} \mathrm{C}$ commands. As the Setup Window is only available once after POR, applications which do not have control over the IQS253 supply, or have more than one IQS253 on the bus should use the FG option to select
between Self or Projected capacitance.

### 9.2 Event Mode

IQS253 by default be configured to only communicate with the master if a change in an event occurs (except for the Setup Window after POR). For this reason, it would be highly recommended to use the RDY line when communicating with the IQS253. These communication requests are referred to as EVENT Mode (only change of events are reported). Event mode can be disabled by setting the EVENT_MODE_DISABLE bit. The events responsible for resuming communication can be chosen through the EVENT_MASK register. By default all events are enabled. The master has the capability to force a communication window at any time, by pulling the RDY line low. The communication window will open directly following the current conversion.

The IQS253A does not start up in Event Mode, and therefore the MCU is not required to catch the setup window or force a comms window to initialise the IQS253A.

## 9.3 $I^{2} C$ Specific Commands

### 9.3.1 Reset Indication

SHOW_RESET can be read to determine whether a reset occurred on the device. This bit will be a '1' after a reset. The value of SHOW_RESET can be cleared to '0' by writing a ' 1 ' in the ACK_RESET bit.

### 9.3.2 WDT

The WDT is used to reset the IC if a problem (for example a voltage spike) occur during communication. The WDT will time-out after $\mathrm{T}_{\text {WDT }}$ if no valid communication occur for this time.

### 9.3.3 Time-out

If no communication is initiated from the master within the first $\mathrm{t}_{\text {COMms }}$ of the RDY line indicating that data is ready, the IC will resume with the next channel's charge transfers. This time-out can be disabled by setting the TIME_OUT_DISABLE bit.

## 9.4 $\quad I^{2} C$ Read and Write specifics

Please refer to the Memory Map and Sample Code Document for the $I^{2} \mathrm{C}$ read and write specifics as implemented on most ProxSense ${ }^{\circledR}$ devices.

## 10 Boolean Output

Boolean arithmetic can be applied to one or a combination of channels to get a result. This result is available in the BOOLEAN_OUTPUT bit in the TOUCH register. For the self capacitive IQS253 version, a digital signal output pin (B_OUT) exists, which corresponds to the Boolean output bit. This output pin is to be used for level detection on a master controller, or to be used with a FET for LED driving. The pin is not rated to sink or source current. In both the self and projected configuration, the "Event Mode" communication could be triggered on a Boolean based result. The Boolean output will be calculated using:

- DYCAL_OUT if channel is in DYCAL ${ }^{T M}$ mode

TOUCH output if channel is in direct-output mode

### 10.1 Channels for Boolean operation

The channels that should be used to compute the Boolean output bit is chosen in the BOOLEAN_SETTINGS register.

### 10.2 Boolean NOT

A Boolean NOT can be applied to any or all channels.

### 10.3 Boolean AND/OR

The Boolean AND operation will be applied to the chosen channels. The OR operation can alternatively be applied if the BOOLEAN_AND_OR bit is set.

### 10.4 Order of Boolean operation:

1. Choose channels for Boolean operation
2. Should NOT be applied to a channel?

## 3. AND/OR operation?

## 11 RF Noise

### 11.1 Noise Immunity

The IQS253 has advanced immunity to RF noise sources such as GSM cellular telephones, DECT, Bluetooth and WIFI devices. Design guidelines should however be followed to ensure the best noise immunity. The design of capacitive sensing applications can encompass a large range of situations but as a summary the following should be noted to improve a design:
$\square$ A ground plane should be placed under the IC, except under the Cx line.
$\square$ All the tracks on the PCB must be kept as short as possible.

- The capacitor between VDDHI and VSS as well as between VREG and VSS, must be placed as close as possible to the IC.
- A 100 pF capacitor can be placed in parallel with the 1uF capacitor between VDDHI and VSS. Another 100 pF capacitor can be placed in parallel with the 1 uF capacitor between VREG and VSS.

When the device is too sensitive for a specific application a parasitic capacitor (max 5 pF ) can be added between the Cx line and ground.
$\square$ Proper sense electrode and button design principles must be followed.
$\square$ Unintentional coupling of sense electrode to ground and other circuitry must be limited by increasing the distance to these sources or making use of the driven shield.

In some instances a ground plane some distance from the device and sense electrode may provide significant shielding from undesired interference.

When the capacitance between the sense electrode and ground becomes too large the sensitivity of the device may be influenced.

### 11.1.1 RF Detection

In cases of extreme RF interference, the onchip RF detection is suggested. This detector can be enabled by setting the ND bit in the PROX_SETTINGS1 register. By connecting a suitable antenna to the RF pin, it allows the device to detect RF noise and notify the master of possible corrupt data. Noise affected samples are not allowed to influence the LTA filter, and also do not contribute to DYCAL, PROX or TOUCH detection. With the detection of noise, the NOISE bit in SYSFLAGS will be set.

### 11.1.2 RF detector sensitivity

The sensitivity of the RF detector can be selected by setting an appropriate RF detection voltage through the ND_TRIM bits. Please see AZD015 for further details regarding this.

## 12 Electrical Specifications

## Absolute Maximum Specifications

The following absolute maximum parameters are specified for the device: Exceeding these maximum specifications may cause damage to the device.

- Operating temperature
$-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- Supply Voltage (VDDHI - GND)
$\square$ Maximum pin voltage
$\square$ Maximum continuous current (for specific Pins)
$\mathrm{VDDHI}+0.5 \mathrm{~V}$ 2 mA
$\square$ Minimum pin voltage
- Minimum power-on slope

GND - 0.5 V

- ESD protection (HBM)
$100 \mathrm{~V} / \mathrm{s}$
- Moisture Sensitivity Level MSOP-10

### 12.1 General Characteristics (Measured at $25^{\circ} \mathrm{C}$ )

Table 12.1: IQS253 General Operating Conditions - Projected Capacitive Sensor.

| DESCRIPTION | Conditions | PARAMETER | MIN | TYP | MAX | UNIT |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage |  | VDDHI | 1.8 | 3.3 | 3.6 | V |
| Internal regulator output | $1.8 \leq \mathrm{VDDHI} \leq 3.3$ | VREG | 1.62 | 1.7 | 1.79 | V |
| Boost Power operating current | $1.8 \leq \mathrm{VDDHI} \leq 3.3$ <br> LOW_POWER $=00 \mathrm{~h}$ | $\mathrm{I}_{B P}$ |  | 150 | 200 | $\mu \mathrm{~A}$ |
| Low power 32 operating current | $1.8 \leq \mathrm{VDDHI} \leq 3.3$ <br> LOW_POWER $=20 \mathrm{~h}$ | $\mathrm{I}_{\text {LP32 }}$ |  | 13 | $<20$ | $\mu \mathrm{~A}$ |
| Low power 255 operating current | $1.8 \leq \mathrm{VDDHI} \leq 3.3$ <br> LOW_POWER $=\mathrm{FFh}$ | $\mathrm{I}_{\text {LP255 }}$ |  | 4.5 | $<8$ | $\mu \mathrm{~A}$ |

Table 12.2: IQS253 General Operating Conditions - Self Capacitive Sensor.

| DESCRIPTION | Conditions | PARAMETER | MIN | TYP | MAX | UNIT |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage |  | VDDHI | 1.8 | 3.3 | 3.6 | V |
| Internal regulator output | $1.8 \leq \mathrm{VDDHI} \leq 3.3$ | VREG | 1.62 | 1.7 | 1.79 | V |
| Boost Power operating current | $1.8 \leq \mathrm{VDDHI} \leq 3.3$ <br> LOW_POWER $=00 \mathrm{~h}$ | $\mathrm{I}_{B P}$ |  | 135 | 175 | $\mu \mathrm{~A}$ |

| Low power 255 operating current | $1.8 \leq \mathrm{VDDHI} \leq 3.3$ <br> LOW_POWER $=\mathrm{FFh}$ | $\mathrm{I}_{\text {LP255 }}$ |  | 3.5 | $<6$ | $\mu \mathrm{~A}$ |

Table 12.3: Start-up and shut-down slope Characteristics

| Description | Condition | Parameter | MIN | MAX | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| POR | VDDHI Slope $\geq 100 \mathrm{~V} / \mathrm{s}$ | POR |  | 1.6 | V |
| BOD |  | BOD | 1.05 |  | V |

Table 12.4: Debounce employed on IQS253.

| DESCRIPTION | Conditions | Value |
| :---: | :---: | :---: |
| Proximity debounce value | PROX_DEBOUNCE $=0$ | 6 |
|  | PROX_DEBOUNCE $=1$ | 4 |
| Touch debounce value | - | 2 |

Proximity debounce is only adjustable on the IQS253. The value is fixed at 4 on the IQS253A.

### 12.2 Timing Characteristics

Table 12.5: General Timing Characteristics for $1.80 \mathrm{~V} \leq \mathrm{VDDHI} \leq 3.60 \mathrm{~V}$

| SYMBOL | DESCRIPTION | TYP | UNIT |
| :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\text {START-UP }}$ | Start-up time before the Setup Window is iniatiated by the IQS253 | 15 | ms |
| $\mathrm{t}_{\text {COMMS }}$ | Time after which communication window will terminate, if not addressed | 22 | ms |
| $\mathrm{f}_{C X}$ | IC transfer frequency | See XFER_FREQ in IQS253 Memory Map | MHz |
| $\mathrm{t}_{\text {CHARGE }}$ | Charge time of channel | CS * (1/fCX) | ms |
| $\mathrm{t}_{\text {CHANNEL }}$ | Charge time interval | 9.01 ms |  |
| $\mathrm{t}_{\text {SAMPLE }}$ | Sample time of channel | Active channels ${ }^{*} \mathrm{t}_{\text {CHANNEL }}$ | ms |
| $\mathrm{t}_{B P}$ | Channel sampling period in BP and Turbo_Mode = OFF | $\mathrm{t}_{\text {SAMPLE }}$ | ms |
| $\mathrm{t}_{\text {BP_TURBO }}$ | Channel sampling period in BP and Turbo_Mode = OFF | Active channels * $\mathrm{t}_{\text {CHARGE }}$ | ms |
| $\mathrm{t}_{L P}$ | Low Power Charging time | CS* $1 / \mathrm{FCX}$ ) $+\mathrm{t}_{\text {CHARGE }}$ |  |
| $t_{W D T}$ | WDT time-out while communicating | 160 | ms |
| $\mathrm{t}_{\text {DYCAL }}$ | Time before switching to TM in DYCAL ${ }^{T M}$ operation | $225 \leq 250 \leq 275$ | ms |

Table 12.6: IQS253 charging times

| Power Mode | Typical (ms) |
| :--- | :--- |
| Boost Power Mode with Turbo_Mode ON | 4 |
| Boost Power Mode | 9 |
| Low Power Mode 4 | 64 |
| Low Power Mode 8 | 128 |
| Low Power Mode 16 | 256 |
| Low Power Mode 32 | 512 |
| Low Power Mode 64 | 1024 |
| Low Power Mode 255 | 4080 |

Table 12.7: IQS253 DYCAL (OUTPUT_ON_TOUCH = 0) /Proximity Response Times

| Power Mode | Conditions | Min** | Unit |
| :---: | :---: | :---: | :---: |
| Boost Power Mode with Turbo_Mode ON ${ }^{1}$ | Detection with small CS change (prox) and ACF OFF | 135 | ms |
|  | Detection with large CS change (touch) and ACF OFF | 81 |  |
|  | Release time with ACF OFF | 81 | ms |
| Boost Power Mode ${ }^{2}$ | Detection with large CS change (touch) and ACF OFF | 331 | ms |
|  | Release time with ACF OFF | 81 | ms |
| Power Modes ${ }^{3}$ | See example | See example | ms |
|  | See example (take 250 ms off total time) |  | ms |

**Note: Minimum bit set times are dependent on the size of the change in CS caused by the user actuation because the minimum time is a function of the debounce of either the touch / proximity caused. The setting of indication bits are delayed by a charge transfer cycle. With ACF = ON, detection and release times will dramatically increase due to the CS having to go through a filtering process adding a delay

## LP Response time Example:

LOW_POWER $=34 \mathrm{~h}$ (52D): $\mathrm{t}_{L P}=16 \mathrm{~ms} \times 52=832 \mathrm{~ms}$
Channels active $=2: \mathrm{t}_{\text {SAMPLE }}=18 \mathrm{~ms}+9 \mathrm{~ms}$ for extra Channel 2 sampling
ACF = OFF: Fast respose on CS
Large CS change: Touch debounce $=2$
DetectionTimeLP52 $=27+832+(2+1)^{*} 27+250=1.19$ seconds

[^1]

|  |  | $7=47 \mathrm{H}$ (Projected Capacitance) |

## 15 Ordering Information

Orders will be subject to a MOQ (Minimum Order Quantity) of a full reel. Contact the official distributor for sample quantities. A list of the distributors can be found under the "Distributors" section of www.azoteq.com. The IQS253 has $4 I^{2} \mathrm{C}$ sub-addresses available. The default address is $0 \times 44 \mathrm{H}$. For further enquiries regarding this, please contact Azoteq or a local distributor.

| IC NAME | IQS253 | $=$ IQS253 |  |
| :--- | :---: | :--- | :--- |
|  | IQS253A | $=$ | IQS253A |
| BOTTOM MARKING | z | $=$ I $^{2} \mathrm{C}$ Sub Address (hexadecimal) |  |
| PACKAGE TYPE | MS | $=$ MSOP-10 |  |
| BULK PACKAGING | R | $=$ Reel (MSR 4000pcs/reel) - MOQ $=4000 \mathrm{pcs}$ |  |

## 16 Device Revision History

| Revision | Device ID | Package Markings | Comments |
| :---: | :---: | :---: | :---: |
| 0 | 3114 | $\times 3911$ | Projected Bias current default 10uA |
|  |  |  | Unable to float CX/CRX |
|  |  |  | No Event mode with Boolean Output enabled |
| 1 | 4100 | $\times 0112$ or later | Projected Bias current default 5uA |
| 2 | 4101 | xxx14 or later | IQS253A |

## 17 Errata

$\square$ The 'z' field is omitted on the package marking on batch code 21512. The configuration is '0' on this lot.
$\square$ The Boolean output pin cannot be used in low power mode, if Event Mode communication is to be used. This only applies to IQS253, and not IQS253A.

Channels can not be disabled if Low Power mode is required. This only applies to IQS253, and not IQS253A.

## A DYCAL Illustrations

To view the illustrations in Appendix A, the document requires to be opened with Adobe Reader Version 6 or later. Note that all illustrations are supplementary, and are not required to use with the datasheet.

Figure A.1: DYCAL output selected on proximity, for a projected capacitive IC. Note that the IC still only enters TM (Touch Mode) when the counts exceed the touch threshold, but the DYCAL output is active after exceeding the proximity threshold.

Figure A.2: DYCAL output selected on touch, for a projected capacitive IC. Note that the DYCAL output is only active when the IC enters TM (Touch Mode) when the counts exceed the touch threshold.

Figure A.3: Filter halt upon Touch Mode Entry, for a self capacitive IC. The LTA will halt upon proximity detection (regardless on which output DYCAL was selected). However, when a touch condition is registered, the filter will stop halting, to allow the LTA to follow the counts.

## B IQS253 Memory Map

The Memory Map of the IQS253 is provided in this section, along with a description of each register and instruction. The IQS253 communicates via $I^{2} C$. For an example implementation that provides example code, refer to AZD062.

The general ProxSense ${ }^{\circledR}$ Memory Map is shown below.

| Address | Access | Size(Bytes) | Device Information |
| :---: | :---: | :---: | :---: |
| $\mathbf{0 0 H} \mathbf{0 F H}$ | R | 16 |  |

| Address | Access | Size(Bytes) | Device Specific Data |
| :---: | :---: | :---: | :---: |
| $\mathbf{1 0 H} \mathbf{3 0 H}$ | $R$ | 32 |  |

| Address | Access | Size(Bytes) | Proximity Status Bytes |
| :---: | :---: | :---: | :---: |
| $\mathbf{3 1 H} \mathbf{3 4 H}$ | R | 4 |  |

| Address | Access | Size(Bytes) | Touch Status Bytes |
| ---: | :---: | :---: | :---: |
| $\mathbf{3 5 H} \mathbf{3 8 H}$ | R | 4 |  |

| Address | Access | Size(Bytes) | Halt Bytes |
| :---: | :---: | :---: | :---: |
| $\mathbf{3 9 H} \mathbf{- 3 C H}$ | R | 4 |  |

| Address | Access | Size(Bytes) | Active Bytes (indicate cycle) |
| :---: | :---: | :---: | :---: |
| 3DH-41H | R | 4 |  |

| Address | Access | Size(Bytes) | Counts |
| :---: | :---: | :---: | :---: |
| $\mathbf{4 2 H} \mathbf{- 8 2 H}$ | $R$ | 64 |  |

| Address | Access | Size(Bytes) |  |
| :---: | :---: | :---: | :---: |
| 83H-C3H | R/W | 64 | LTAs |

| Address | Access | Size(Bytes) | Device Settings |
| :---: | :---: | :---: | :---: |
| C4h-FDh | R/W | 64 |  |

Note: FE and FF are reserved for other functions in communication.

## B. 1 Device Information

| 00H |  | Product Number (PROD_NR) |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Access | Bit | 7 | 6 | 5 |  | 4 | 3 | 2 | 1 | 0 |
| R | Value | 41 (Decimal) |  |  |  |  |  |  |  |  |
| 01H |  | Software Number (SW_NR) |  |  |  |  |  |  |  |  |
| Access | Bit | 7 | 6 | 5 |  | 4 | 3 | 2 | 1 | 0 |
| R | Value | SW_NR |  |  |  |  |  |  |  |  |

## [00H] PROD_NR

The product number for the IQS253 is 41 (decimal).

## [01H] SW_NR

The software version number of the device ROM can be read in this byte. Production version IC's SW numbers are 0 for Self and Projectd. The Engineering version numbers are shown below.

| IQS253 sw nr | Description |
| :---: | ---: |
| 13 (decimal) | IQS253-3 Channel Self Capacitive Sensor version 1 |
| 14 (decimal) | IQS253-3 Channel Projected Sensor version 1 |

## B. 2 System Flags

| 10H |  | System Flags (SYSFLAGS) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Access | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | Name | System_ Use | SYSTEM Use | $\begin{aligned} & \text { SHOW_ } \\ & \text { Reset } \end{aligned}$ | PROJ Mode | LP | ATI_ Busy | Noise | Zoom |

[10H] SYSFLAGS

## bit 7: SYSTEM_USE

## bit 6: SYSTEM_USE

bit 5: SHOW_RESET: This bit can be read to determine whether a reset occurred on the device since the ACK_RESET bit has been set. The value of SHOW_RESET can be set to 0 by writing a 1 in the ACK_RESET bit in the PROX_SETTINGS_2 byte.
bit 4: PROJ_MODE: Capacitive Sensing Technology used
$0=$ Self Capacitive sensing
1 = Projected Capacitive sensing
bit 3: LP: If a LP mode is enabled, this bit indicates that charging is currently occurring in a LP rate.

0 = Full-speed charging

1 = Charging currently occur at a lower rate
bit 2: ATI_BUSY: Status of automated ATI routine
$0=$ Auto ATI is not busy
1 = Auto ATI in progress
bit 1: NOISE: This bit indicates the presence of noise interference.
$0=I C$ has not detected the presence of noise
$1=I C$ has detected the presence of noise
bit 0: ZOOM: Zoom will indicate full-speed charging once an undebounced proximity is detected. In NP mode, this will not change the charging frequency.
$0=I C$ not zoomed in
$1=I C$ detected undebounced proximity and IC is charging at full-speed

## B. 3 Proximity Status Bytes

The proximity status of all the channels on the device are shown here. These bits should not be monitored if the IC is in DYCAL mode.

| 31H |  | Proximity Status (PROX) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Access | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | Name |  |  |  |  |  | CH2 | CH1 | CHO |

## [31H] PROX

The proximity status of the channels is indicated in this byte. The PROX bit of a channel should not be used if a channel is set as a DYCAL channel.

## bit 7-3: SYSTEM_USE

bit 2: CH2: Indicate that a proximity event has been detected on CH 2
$0=$ No proximity event detected
1 = Proximity event detected
bit 1: CH1: Indicate that a proximity event has been detected on CH 1
$0=$ No proximity event detected
1 = Proximity event detected
bit 0: CH0: Indicate that a proximity event has been detected on CHO
$0=$ No proximity event detected
1 = Proximity event detected

## B. 4 Touch Status Bytes

The touch status of all the channels on the device are shown here. These bits should not be monitored if the IC is in DYCAL mode.

| 35H | Touch Status (TOUCH) |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Access       <br> $\mathbf{R}$ 7 6 5 4 3 2 <br> 1 1 0     <br> Name Boolean_Output     CH 2 <br> CH 1 CH 0      |  |  |  |  |  |  |  |  |

## [35H] TOUCH

The touch status of the channels is indicated in this byte. The TOUCH bit of a channel should not be used if a channel is set as a DYCAL channel.
bit 7: BOOLEAN_OUTPUT: A Boolean combination can be outputted to this bit. The Boolean combination can be configured through bytes BOOLEAN_SETTINGS and BOOLEAN_NOT. This bit will correspond with the output status of the B_OUT pin of the IQS253 Self capacitive IC.

0 = Boolean Output not active

1 = Boolean Output active

## bit 6-3: Unused

bit 2: $\mathbf{C H} 2$ : Indicate that a touch event has been detected on CH 2
$0=$ No touch event detected

1 = Touch event detected
bit 1: CH1: Indicate that a touch event has been detected on CH 1
$0=$ No touch event detected

1 = Touch event detected
bit 0: CHO: Indicate that a touch event has been detected on CH 0
$0=$ No touch event detected
1 = Touch event detected

## B. 5 DYCAL Touch Mode indication

| 36H |  | DYCAL TM Indication (DYCAL_TM) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name |  |  |  |  |  | CH 2 | CH1 | CHO |
| R | Note | Indicates if Channel is in TM |  |  |  |  |  |  |  |

## [36H] DYCAL_TM

If a channel is configured as a DYCAL channel, these bits will indicate whether TM has been entered. TM is entered once the touch threshold of a channel has been exceeded.

## Bit 7-3: Unused

Bit 2: CH2: CH2 TM indication
$0=$ Channel not in TM
1 = Channel in TM
Bit 1: $\mathrm{CH} 1: \mathrm{CH} 1$ TM indication
$0=$ Channel not in TM
1 = Channel in TM
Bit 0: CHO: CHO TM indication
$0=$ Channel not in TM
$1=$ Channel in TM

## B. 6 DYCAL Output indication

| 37H |  | DYCAL Output Indication (DYCAL_OUT) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name |  |  |  |  |  | CH2 | CH 1 | CHO |
| R |  | Indicates a DYCAL detection on a channel |  |  |  |  |  |  |  |

[37H] DYCAL_OUT
If a channel is configured as a DYCAL channel, these bits will indicate whether the DYCAL output is set. It will default be set with the detection of a proximity, but can be set by a touch by configuring bit DYCAL_SETTINGS:OUTPUT_ON_TOUCH.

## Bit 7-3: Unused

Bit 2: CH2: CH2 DYCAL output
$0=$ DYCAL not detected

1 = DYCAL detected
Bit 1: CH1: CH1 DYCAL output
$0=$ DYCAL not detected
1 = DYCAL detected
Bit 0: CHO: CHO DYCAL output
$0=$ DYCAL not detected
1 = DYCAL detected

## B. 7 Halt Bytes

The LTA filter halt status of all the channels are shown here.

| $\mathbf{3 9 H}$ | LTA Halt Status (HALT) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Access |  |  |  |  |  |  |  |
| $\mathbf{R}$ |  |  |  |  |  |  |  | | Bit | 7 | 6 | 5 | 4 | 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 1 | 0 |  |  |  |
| Name |  |  |  |  |  |
| CH 2 | CH 1 | CH 0 |  |  |  |

## [39H] HALT

Indicate the halting state of each channels Long Term Average (LTA). If in non-TM, the halt bit of a channel will be set once proximity is detected. Once a touch is detected, the IC will enter TM and the halt bit will be cleared. The halting bit will now only be set again if the CS exceeds the LTA by 16 in Self or if the CS is less than the LTA by more than 16 in Projected mode.

## Bit 7-3: Unused

Bit 2: CH2: CH2 LTA halting state
$0=$ Channels LTA adapts to the environment
1 = Channels LTA halted
Bit 1: $\mathrm{CH} 1: \mathrm{CH} 1$ halting state
$0=$ Channels LTA adapts to the environment
1 = Channels LTA halted
Bit 0: CH0: CHO halting state
$0=$ Channels LTA adapts to the environment
1 = Channels LTA halted

## B. 8 Channel Number

## [3DH] CHAN_NUM

The channel number that can be read in this byte indicates which channels data is currently available.

## B. 9 Counts

The Counts of the current channel is available here.

## [42H \& 43H] CS_H \& CS_L

The counts for the current channel can be read in this byte. The HIGH byte and LOW byte are found in consecutive addresses.

## B. 10 Long-Term Averages

The Long-Term average of the current channel is available here to read.

## [83H \& 84H] LTA_H \& LTA_L

The LTA value for the current channel can be read in this byte. The HIGH byte and LOW byte are found in consecutive addresses.

## B. 11 Device Settings

It is attempted that the commonly used settings are situated closer to the top of the memory block. Settings that are regarded as more once-off are placed further down.

## B. 12 ATI Target

| C4H |  | ATI Target Value (ATI_TARGET) |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 |  |  |
| Access | Value | ATI Target value ( $\times 8$ to get real target) |  |  |  |  |  |  |  |  |
| R/W | Default | 1 | 0 | 0 | 0 | 0 | 0 | 0 |  |  |
|  | Note | 128 Decimal ( $\times 8$ gives Target value $=1024$ ) |  |  |  |  |  |  |  |  |

## [C4H] ATI_TARGET

The IQS253 default target is 1024 counts. The IQS253A default target is 512 counts. The automated ATI target can be set in this byte. The value written to this byte multiplied by 8 will be the target value of all 3 channels. If a new target value is required, the required target (divided by 8 ) should be written to this byte, where-after a re-ATI event should be sent. All 3 channels will now be at the target value once the SYSFLAGS_ATI_BUSY flag is cleared. ATI Multiplier and Compensation

The ATI Multiplier and ATI Compensation bits allow the controller to be compatible with a large range of sensors, and in many applications with different environments. ATI allows the user to maintain a specific sample value on all channels. The ATI Multiplier parameters would produce the largest changes in sample values and can be thought of as the high bits of ATI. The ATI Compensation bits are used to influence the sample values on a smaller scale to provide precision when balancing all channels as close as possible to the target. The ATI Multiplier parameters are further grouped into two parameters namely ATI Multiplier- Compensation and ATI Multiplier-Sensitivity. ATI multiplier-Compensation consists of 2 bits and has the biggest effect on the sample value and can be considered as the highest bit of the ATI parameters. The ATI Multiplier-Sensitivity can be adjusted with 4 bits for each channel. The value of 1111 would provide the highest CS value and the value of 0000 would provide the lowest.

## B. 13 Compensation

| C5H |  | CH0 Compensation (COMPO) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Value | Automatically adjusted when ATI enabled |  |  |  |  |  |  |  |
| R/W | Default | 0 |  |  |  |  |  |  |  |

## [C5H, C6H, C7H] Compensation Settings (CH0_COMP, CH1_COMP, CH2_COMP)

The compensation settings for each channel are contained in these bytes. The values in these bytes are automatically determined if the Auto ATI function was used. If PROX_SETTINGSO:ATI_OFF is set, the Automatic ATI setting is disabled and this byte can be altered to achieve a custom target value. The ATI Compensation parameter can be configured for each channel in a range between 0-255 (decimal). The ATI compensation bits can be used to make small adjustments of the sample values of the individual channels.

## B. 14 Base Values

| C8H |  | CHO ATI BASE and Multipliers (CHO_ATI_BASE) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Value | $\begin{gathered} \hline \text { CHO- } \\ \text { BASE1 } \end{gathered}$ | $\begin{gathered} \mathrm{CHO} \\ \text { BASE0 } \end{gathered}$ | $\begin{aligned} & \hline \text { MULT_- } \\ & \text { SENSE1 } \end{aligned}$ | $\begin{aligned} & \hline \text { MULT_- } \\ & \text { SENSEO } \end{aligned}$ | $\begin{aligned} & \text { MULT_- }_{\text {COMP3 }} \end{aligned}$ | $\begin{aligned} & \text { MULT_- }_{\text {COMP2 }} \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { COMP1 } \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { COMPO } \end{aligned}$ |
| R/W |  |  |  | gain |  | scale |  |  |  |

| $\mathrm{C9H}$ |  | CH1 ATI BASE and Multipliers (CH1_ATI_BASE) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access |  | $\begin{aligned} & \mathrm{CH} 1- \\ & \text { BASE1 } \end{aligned}$ | $\begin{aligned} & \mathrm{CH} 1- \\ & \text { BASE0 } \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { SENSE1 } \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { SENSEO } \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { COMP3 } \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { COMP2 } \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { COMP1 } \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { COMPO } \end{aligned}$ |

| CAH |  | CH2 ATI BASE and Multipliers (CH2_ATI_BASE) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access R/W |  | $\begin{aligned} & \mathrm{CH2} \\ & \text { BASE1 } \end{aligned}$ | $\begin{aligned} & \text { CH2 } \\ & \text { BASEO } \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { SENSE1 } \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { SENSEO } \end{aligned}$ | $\begin{aligned} & \text { MULT- } \\ & \text { COMP3 } \end{aligned}$ | $\begin{aligned} & \text { MULT_- }_{\text {COMP2 }} \end{aligned}$ | $\begin{aligned} & \text { MULT_- } \\ & \text { COMP1 } \end{aligned}$ | $\begin{aligned} & \text { MULT_- }_{\text {COMPO }} \end{aligned}$ |

## [C8H, C9H, CAH] Base values and Multiplier settings (CH0_BASE, CH1_BASE, CH2_BASE)

The base value or Multiplier settings of each channel can be set in these bytes.
Bit 7-6: CHx_BASE1:CHx_BASE0: Channel Base Values

```
ALT_BASE = 0
```

$00=200$ (IQS253 default)
$01=50$
$10=100$ (IQS253A default)
$11=250$

ALT_BASE = 1
$00=150$
$01=350$
$10=500$
$11=700$

Bit 5-4: MULT_SENSE1:MULT_SENSE0: Sensitivity Multiplier Settings. Rough adjustments of base counts.
$00=1$ (small electrodes)
11 = 4 (large electrodes)
Bit 3-0: MULT_COMP3:MULT_COMP0: Compensation Multiplier Settings. Fine adjustments of base counts.
$0000=1$ (smallest)
$1111=18$ (largest)

## B. 15 Proximity Thresholds

| CBH |  | Proximity Threshold (PROX_THR_CHO) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name | PT_7 | PT_6 | PT_5 | PT_4 | PT_3 | PT_2 | PT_1 | PT_0 |
| R/W | Default | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

| CCH |  | Proximity Threshold (PROX_THR_CH1) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name | PT_7 | PT_6 | PT_5 | PT_4 | PT_3 | PT_2 | PT_1 | PT_0 |
| R/W | Default |  |  | 0 | 0 | 0 | 1 | 0 | 0 |

| CDH |  | Proximity Threshold (PROX_THR_CH2) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name | PT_7 | PT_6 | PT_5 | PT_4 | PT_3 | PT_2 | PT_1 | PT_0 |
| R/W | Default |  |  | 0 | 0 | 0 | 1 | 0 | 0 |

[CBH, CCH \& CDH] Proximity Sensitivity Settings (PROX_THR_CHx)
Proximity sensitivity thresholds can be anything from 1 to 64.

## B. 16 Touch Thresholds

| CEH |  | Touch Threshold (TOUCH_THR_CHO) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name | TT_7 | TT_6 | TT_5 | TT_4 | TT_3 | TT_2 | TT_1 | TT_0 |
| R/W | Default | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
|  | Note | Touch ${ }_{\text {THR }}=($ value $/ 256$ * LTA) |  |  |  |  |  |  |  |

| CFH |  | Touch Threshold (TOUCH_THR_CH1) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name | TT_7 | TT_6 | TT_5 | TT_4 | TT_3 | TT_2 | TT_1 | TT_0 |
| R/W | Default | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
|  | Note | Touch ${ }_{\text {THR }}=($ value / 256 * LTA) |  |  |  |  |  |  |  |

| DOH |  | Touch Threshold (TOUCH_THR_CH2) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name | TT_7 | TT_6 | TT_5 | TT_4 | TT_3 | TT_2 | TT_1 | TT_0 |
| R/W | Default | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
|  | Note | Touch ${ }_{\text {THR }}=($ value / 256 * LTA) |  |  |  |  |  |  |  |

## [CEH, CFH \& DOH]Touch Sensitivity Settings (TOUCH_TH_CHx)

Touch sensitivity thresholds are calculated as a fraction of the LTA: Touch $_{T H R}=($ TOUCH_THR_CHx / 256 * LTA). There are 255 possible touch threshold values. The default value for IQS253 is (72 / 256), while IQS253A is ( $32 / 256$ ).

## B. 17 ProxSettings0

| D1H |  | ProxSense Module Settings 0 (PROX_SETTINGSO) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Value | $\begin{aligned} & \text { ATI_ } \\ & \text { OFF } \end{aligned}$ | ATI PARTIAL | $\begin{gathered} \text { 10s_ATI- } \\ \text { BLOCK } \end{gathered}$ | $\begin{gathered} \text { REDO_ } \\ \text { ATI } \end{gathered}$ | RESEED | $\begin{aligned} & \text { CS_ } \\ & \text { SIZE } \end{aligned}$ | $\begin{aligned} & \text { PROJ_ } \\ & \text { BIAS1 } \end{aligned}$ | $\begin{aligned} & \text { PROJ_ } \\ & \text { BIASO } \end{aligned}$ |
| R/W | Default | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 1 |

## [D1H] PROX_SETTINGSO

Bit 7: AUTO_ATI: Disables the automated ATI routine. By enabling this bit, the device will not be able to redo ATI if the counts are outside their boundaries.
$0=$ Auto ATI routine active

1 = ATI disabled
Bit 6: ATI_PARTIAL: Enable Partial ATI.
$0=$ If ATI occur, it will use the base values as reference
1 = If ATI occur, it will use the MULTIPLIER_COMPx and MULTIPLIER_SENSx as reference
Bit 5: ATI_BLOCK: Enable the 10 second block of ATI after an actuation.
$0=$ Channels will always redo ATI if LTA is outside boundaries if no actuation is detected
$1=$ ATI will be blocked for 10 seconds after an actuation has occurred.
Bit 4: REDO_AUTO_ATI: Force the ATI routine to perform. The last written ATI_TARGET value will be used as target.
$0=$ No action
1 = Force ATI routine to perform.
Bit 3: RESEED: Reseed the LTA filter. This can be used to adapt to an abrupt environment change, where the filter is too slow to track this change. Note that with the Short and Long Halt selections, an automatic Reseed will be performed when the halt time has expired, thus automatically adjusting to the new surroundings.
$0=$ Do not reseed
1 = Reseed (this is a global reseed)
Bit 2: CS: Set the size of the internal sampling capacitor. A larger CS capacitor requires more transfers (higher counts) to be charged.
$0=29.9 p F$
$1=59.8 \mathrm{pF}$
Bit 1-0: PROJ_BIAS1:PROJ_BIAS0: Projected Bias Current
$00=1.25 u \mathrm{u}$ (smallest)
$01=2.5 u \mathrm{~A}$
$10=5 u A$
$11=10 u A$

## B. 18 ProxSettings1

| D2H |  | ProxSense Module Settings 1 (PROX_SETTINGS1) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Value | PROJ | ALT BASE | Turbo Mode | HC | ND | $\begin{aligned} & \text { ND_- } \\ & \text { TRIMO } \end{aligned}$ | $\begin{aligned} & \mathrm{ND}- \\ & \text { TRIMO } \end{aligned}$ | $\begin{aligned} & \text { ND_- } \\ & \text { TRIMO } \end{aligned}$ |
| R/W | Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

## [D2] PROX_SETTINGS1

Bit 7: PROJ: Use the IQS253 in projected mode. This setting can only be enabled in the SETUP communications window. Alternatively, us the FG option.

0 = IQS253 in Self Capacitive sensing mode
1 = IQS253 in Projected Capacitive sensing mode
Bit 6: ALT_BASE: Set this bit to choose the alternative base values
$0=$ Normal base values
1 = Alternative base values

Bit 5: Turbo_Mode: Enable the DYCAL Turbo functionality (If DYCAL is enabled). By enabling this bit, the device will drastically decrease the time to detect users proximity and touch events.
$0=$ Normal

1 = Enable Turbo Mode
Bit 4: HC: Halt charges. The device will not perform capacitive sensing charge transfers and thus not be able to detect any user events.
$0=$ Charge transfers occur normally
1 = No charge transfers occur
Bit 3: ND: Noise Detection Enable. This setting is used to enable the on-chip noise detection circuitry. With noise detected, the noise affected samples will be ignored, and have no effect on the Prox, touch or LTA calculations. The NOISE bit will appropriately be set as indication of the noise status.

0 = Disable noise detection

1 = Enable noise detection

Bit 2-0: ND_TRIM2:ND_TRIMO: ND Trim values
$000=19.1 \mathrm{mV}$
$001=9.65 \mathrm{mV}$

```
010=0mV
011 = -10mV
100=-19.1mV
101 =-29.8mV
110=-40.9mV
111= -57.4mV
```

## B. 19 ProxSettings2

| D3H |  | ProxSense Module Settings 2 (PROX_SETTINGS2) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Value | $\begin{gathered} \hline \text { ACK_ } \\ \text { RESET } \end{gathered}$ | COMMS WDT DISABLE | $\begin{gathered} \hline \text { FORCE- } \\ \text { HALT } \end{gathered}$ | ACF DISABLE | TIME OUT DISABLE | EVENT MODE DISABLE | HALT1 | HALTO |
| R/W | Default | 0 (W) | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

## [D3H] PROX_SETTINGS2

Bit 7: ACK_RESET: Acknowledge SHOW_RESET.
$0=$ Nothing
1 = Clear the SHOW_RESET flag (send only once)
Bit 6: WDT_DISABLE: Device watchdog timer (WDT) disable.
$0=$ Enabled
1 = Disabled
Bit 5: FORCE_HALT: The LTA is halted by setting this bit. It will only be allowed to adapt to the environment once it is cleared.
$0=$ LTA adapts to environment until actuation detected.
1 = Halt LTA.
Bit 4: ACF_DISABLE: Disable the AC Filter employed on the Counts (CS).
$0=$ Enable AC filter.
1 = Disable AC filter.
Bit 3: TIME_OUT_DISABLE: Enable $\mathrm{I}^{2} \mathrm{C}$ communication timeout. This bit will enable the IC to resume charge transfers if communication does not commence within 20ms of the RDY indicating that data is ready.
$0=$ Disable time-out.
1 = Enable time-out.

Bit 2: EVENT_MODE_DISABLE: Enable the IC to stream data continuously.
$0=I^{2} \mathrm{C}$ Communication will only occur if an event occur (events defined in EVENT_MODE_MASK byte)
$1=$ Continuous streaming mode
Bit 1-0: HALT1:HALT0: LTA halt timings.
$00=20 s$
$01=40 \mathrm{~s}$
$10=$ Never

11 = Always

## B. 20 ProxSettings3

|  |  | ProxSense Module Settings 3 (PROX_SETTINGS3) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | ---: |
|  | D4H | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 |$| 0$

## [D4H] PROX_SETTINGS3

Bit 7: ATI Error This bit should be periodically monitored. It will be set if the ATI algorithm could not reach the set target.

## Bit 6: Unused

Bit 5-4: LTA_ADAPT: Rate at which LTA adapts to CS when no actuation is detected (non- TM mode).
$00=3.13 \%$ (fastest)
$01=1.56 \%$
$10=0.78 \%$
$11=0.39 \%$ (slowest)

## Bit 3: Unused

Bit 2: PROX_DEBOUNCE: Number of consecutive CS samples required exceeding proximity threshold to detect a proximity event.
$0=6$
$1=4$
Bit 1-0: XFER_FREQ1:XFER_FREQ0: Charge transfer frequency.

$$
\begin{aligned}
& 00=1 \mathrm{MHz} \\
& 01=500 \mathrm{kHz} \\
& 10=250 \mathrm{kHz} \\
& 11=125 \mathrm{kHz}
\end{aligned}
$$

The charge transfer frequency is a very important parameter. Dependant on the design application, the device frequency must be optimised. For example, if keys are to be used in an environment where steam or water droplets could form on the keys, a higher transfer frequency improves immunity. Also, if a sensor electrode is a very large object/size, then a slower frequency must be selected since the capacitance of the sensor is large, and a slower frequency is required to allow effective capacitive sensing on the sensor.

## B. 21 Active Channels

| D5H |  | Active Channels (ACTIVE_CHAN) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Value |  |  |  |  |  | CH2 | CH1 | CHO |
| R/W | Default |  |  |  |  |  | 1 | 1 | 1 |

## [D5H] ACTIVE_CHAN

Each channel can be individually disabled in this register.

## Bit 7-3: Unused

Bit 2: CH2: Clearing a bit will disable the channel
0 = Inactive / Not charging
1 = Active / Charging
Bit 1: CH1: Setting this bit will disable the channel
$0=$ Inactive $/$ Not charging
1 = Active / Charging
Bit 0: $\mathbf{C H O}$ : Setting this bit will disable the channel
$0=$ Inactive $/$ Not charging
1 = Active / Charging

## B. 22 Low Power

| D6H |  | Low Power Settings (LOW_POWER) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Value | LP7 | LP6 | LP5 | LP4 | LP3 | LP2 | LP1 | LP0 |
| R/W | Default | Normal Power default (00H). See Note below. |  |  |  |  |  |  |  |
|  | Note | Custom value between 1 and 256 value $\times 16 \mathrm{~ms} \mathrm{LP} \mathrm{time}$ |  |  |  |  |  |  |  |

## [D6H] LP_PERIOD

Byte indicates the sleep time between a burst of conversions. Default ( 00 H ), a channel is charged every 27 ms . The LP time can be set to any custom value between 1 and 256 . The time between the conversions will then be the value $\times 16 \mathrm{~ms}$. (NOTE: CX2 does a dummy conversion before the burst of the active channels are executed.)

## B. 23 DYCAL Settings

| D7H |  | DYCAL Specific Settings (DYCAL_SETTINGS) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Value | $\begin{gathered} 250 \mathrm{~ms} \\ \text { DELAY_ } \\ \text { TM } \end{gathered}$ | ALWAYS HALT DYCAL | BETA <br> TM_ OUT1 | BETA <br> TM_ OUTO | $\begin{aligned} & \text { BETA_ } \\ & \text { TM_IN } \end{aligned}$ | OUTPUT_ ON_ TOUCH | $\begin{aligned} & \text { REL_ } \\ & \text { THR1 } \end{aligned}$ | $\begin{aligned} & \text { REL_ } \\ & \text { THRO } \end{aligned}$ |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
| R/W | Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

## [D7H] DYCAL_SETTINGS

Byte indicates which channels are actively charged.
Bit 7: 250ms_DELAY_TM: A 250ms delay is applied on the LTA when a touch is detected, before the LTA is reseeded to the LTA-TOUCH_THR
$0=$ Enabled
1 = Disabled
Bit 6: ALWAYS_HALT_DYCAL: Always halt LTA in TM if CS exceeds LTA by 16 (Self) or if CS is lower than LTA by 16 (projected)
$0=$ Halting of LTA in TM according to HALT1:HALTO settings
$1=$ Always halt LTA if above condition is met
Bit 5-4: LTA_ADAPT_IN: Rate at which LTA adapts after reseed when heading towards the CS in TM
$00=1.56 \%$
$01=6.25 \%$ (fastest)
$10=3.13 \%$
$11=0.78 \%$ (slowest)

Bit 3: LTA_ADAPT_OUT: Rate at which LTA adapts after its reached CS, when CS is heading out of TM.
$0=0.10 \%$ (fastest)
$1=0.01 \%$ (slowest)
Bit 2: OUTPUT_ON_TOUCH: Setting this bit will enable the DYCAL output to change with touch actuation.

0 = DYCAL on Proximity

1 = DYCAL on Touch
Bit 1-0: RELEASE_THR1:RELEASE_THR0: Release threshold with which CS should exceed LTA for LTA to reseed back to non-TM.
$00=75 \%$
$01=50 \%$
$10=87.5 \%$
$11=100 \%$

## B. 24 DYCAL Enable

| D8H |  | DYCAL Channels Enable (DYCAL_CHANS) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name |  |  |  |  | BLOCK_ON_CH1_ENABLE | CH2 | CH1 | CHO |
| R/W | Default |  |  |  |  | 0 | 1 | 1 | 1 |

[D8H] DYCAL enable and Block channel enable (DYCAL_CHANS)
Channels are default configured as DYCAL channels. Clearing a channel bit, will make it a direct output channel.

## Bit 7-4: Unused

Bit 3: CH1_BLOCK: Setting this bit will make channel 1 a block channel
$0=$ Normal output
$1=\mathrm{CH} 1$ will block the output of the other channels if actuated

Bit 2: CH2: Clearing this bit, will make the channel a direct output channel
$0=$ Direct Output channel

1 = DYCAL channel

Bit 1: CH1: Clearing this bit, will make the channel a direct output channel
$0=$ Direct Output channel

1 = DYCAL channel

Bit 0: CH0: Clearing this bit, will make the channel a direct output channel
$0=$ Direct Output channel

1 = DYCAL channel

## B. 25 Event Mask

|  |  | EVENT MODE MASK (EVENT_MASK) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D9H | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | Access | Name |  |  | ATI | DYCAL | BOOLEAN | NOISE | TOUCH |
| PROX |  |  |  |  |  |  |  |  |  |
|  | Pefault |  |  | 1 | 1 | 1 | 1 | 1 |  |

[D9H] Event Mode mask (EVENT_MASK)

## Bit 7-6: Unused

Bit 5: ATI: A communication event will occur if an ATI or re-ATI occurs.
$0=$ Communication event will not occur

1 = Communication event will occur
Bit 4: DYCAL: A communication event will occur if a DYCAL state change occurs.
$0=$ Communication event will not occur
1 = Communication event will occur

Bit 3: BOOLEAN: A communication event will occur if a Boolean state change occurs.
$0=$ Communication event will not occur

1 = Communication event will occur

Bit 2: NOISE: A communication event will occur if noise is detected.
$0=$ Communication event will not occur

1 = Communication event will occur

Bit 1: TOUCH: A communication event will occur if a proximity state change occurs. Should only be used if a channel is in direct mode.
$0=$ Communication event will not occur

1 = Communication event will occur
Bit 0: PROXIMITY: A communication event will occur if a proximity state change occurs. Should only be used if a channel is in direct mode.
$0=$ Communication event will not occur
1 = Communication event will occur

## B. 26 Boolean Settings

| DAH |  | Boolean Settings (BOOLEAN_SETTINGS) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Value |  |  |  |  | BOOL_ AND_OR | MASK_CH2 | MASK_CH1 | MASK_CHO |
| R/W | Default |  |  |  |  | 0 | 0 | 0 | 0 |

## [DAH] BOOLEAN_SETTINGS

## Bit 7-4: Unused

Bit 3: BOOLEAN_AND_OR: Boolean AND operation on the channels chosen to perform this action on
$0=$ Boolean AND operation
1 = Boolean OR operation
Bit 2: CH2: Use this channel in the Boolean operation
$0=$ No
$1=\mathrm{Yes}$
Bit 1: CH1: Use this channel in the Boolean operation
$0=\mathrm{No}$
$1=\mathrm{Yes}$

Bit 0: CH0: Use this channel in the Boolean operation
$0=$ No
$1=\mathrm{Yes}$

| DBH |  | Boolean NOT Mask (BOOLEAN_NOT) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access | Name |  |  |  |  |  | NOT_CH2 | NOT_CH1 | NOT_CH0 |
| R/W | Default |  |  |  |  |  | 0 | 0 | 0 |

## [DBH] BOOLEAN_NOT

## Bit 7-3: Unused

Bit 2: CH2: Invert this channels polarity (NOT operation)
$0=$ No action
1 = NOT Channel (Invert channel polarity)
Bit 1: CH1: Invert this channels polarity (NOT operation)
$0=$ No action
1 = NOT Channel (Invert channel polarity)
Bit 0: CHO: Invert this channels polarity (NOT operation)
$0=$ No action
1 = NOT Channel (Invert channel polarity)

## B. 27 Comms Pointer

## [DDH] Default Comms Pointer

The value stored in this register will be loaded into the Comms Pointer at the start of a communication window. For example, if the design only requires the Proximity Status information each cycle, then the Default Comms Pointer can be set to ADDRESS 31H. This would mean that at the start of each communication window, the comms pointer would already be set to the Proximity Status register, simply allowing a READ to retrieve the data, without the need of setting up the address. This functionality is only available on the IQS253A, not the IQS253.

## B. 28 General Implementation Hints

When implementing the communication interface with the IQS253, please refer to the IQS253 datasheet for a detailed description of the $I^{2} \mathrm{C}$ communication. This section contains some general guidelines and hints regarding the communication interface.

## B. 29 I²C Communication window

When communicating via $I^{2} \mathrm{C}$, the communication window will automatically close when a STOP bit is received by the IQS253. The IQS253 will then proceed to start with a new conversion and the READY line will be pulled low until the new conversion is complete. Note that there is no command via $I^{2} \mathrm{C}$ to initiate a new conversion. To perform multiple read and write commands, the repeated start function of the $I^{2} \mathrm{C}$ must be used to stack the commands together.

## B. 30 Start-up Procedure

After sending initial settings to the IQS253, it is important to execute a reseed. It is suggested to execute an estimated 24 conversions after initial settings before calling for a reseed, to allow the system to stabilise.

## B. 31 General I ${ }^{2} \mathbf{C}$ Hints

## B.31.1 I ${ }^{2} \mathrm{C}$ Pull-up resistors

When implementing $\mathrm{I}^{2} \mathrm{C}$ it is important to remember the pull-up resistors on the data and clock lines. 4.7 k is recommended, but for lower clock speeds bigger pull-ups will reduce power consumption. The RDY line is SW OD and also requires a pull up resistor (typical 10k).

## C IQS253 vs IQS253A

| Features | IQS253 | IQS253A |
| :--- | :---: | :---: |
| Start-up | Event Mode | Streaming Mode |
| ATI Target | 1024 | 512 |
| Default Base Values | 200 | 100 |
| Max Parasitic Capacitance | 30 pF | 80 pF |
| Boolean Pin | OD, Floating Output | OD, Active Low Output |
| Halt Time | Active Channel Dependant | Fixed Times |
| Halt Time | Turbo Mode Dependant | Fixed Times |
| LP \& Event Mode | Boolean Output not <br> Available | Boolean Output Available |
| Proximity Debounce | 4 or 6 | Only 4 |
| AC Filter (Count Filter) | Fixed Beta | Variable Beta |
| Default Comms Pointer | $0 \times 10 \mathrm{H}$ | Variable |
| ATI Block | 10 s | 3 s |
| Filter Halt On Exit | Proximity and Touch | Touch Mode Only (3 |
|  | seconds) |  |
| I2C Input Low to High (3.3V) | 2.25 V | 2.05 V |
| I2C Input High to Low (3.3V) | 0.9 V | 1.35 V |
| I2C Input Low to High (1.8V) | 1.15 V | 1.1 V |
| I2C Input High to Low (1.8V) | 0.5 V | 0.6 V |

Figure C.1: IQS253 vs IQS253A.
