

DESCRIPTION

The BDR6307 is a high speed high voltage (600V) driver to control power devices like MOS-transistors or IGBTs in half bridge systems with dependent high and low side referenced output channels. The logic input is compatible with standard CMOS or LSTTL output, down to 3.3V logic. The device includes an under-voltage detection unit with hysteresis characteristic and prevents power devices against large amount of conduction loss, when voltage margin of gate is not high enough. The output drivers feature a high pulse current buffer stage designed for minimum driver cross-conduction. The floating channel can be used to drive an N-channel power MOSFET or IGBT, in the high side configuration which operates up to 600 volts. It is pin and input polarity compatible to IR2101.

FUNCTION DESCRIPTION

LOW SIDE POWER SUPPLY

VCC is the low side supply and it provides power both to input logic and to low side output power stage. The built-in under-voltage lockout circuit enables the device to operate at sufficient power on when a typical VCC supply voltage higher than $V_{CCUV+}=8.6$ is present, shown as Figure1. The IC shuts down the gate drivers outputs, when the VCC supply voltage is below $V_{CCUV-}=8.1$ V, shown as Figure1. This prevents the external power devices from extremely low gate voltage levels during on-state and therefore from excessive power dissipation.

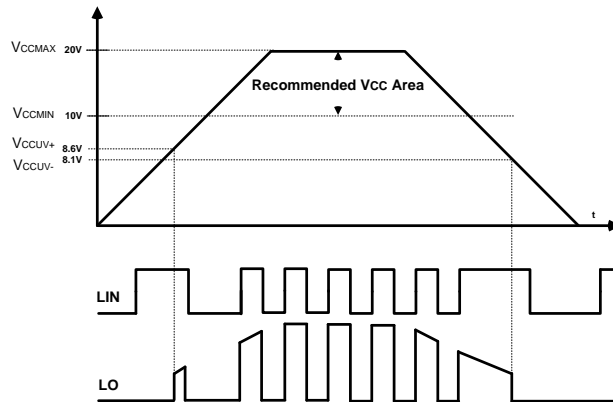

Figure.1: VCC Supply UVLO Operating Area

HIGH SIDE POWER SUPPLY

VB to VS is the high side supply voltage. The totally high side circuitry can float with respect to COM following the external high side power device emitter/source voltage. Due to the internally low power consumption, the whole high side circuitry can be supplied by bootstrap topology connected to VCC, and it can be powered with small bootstrap capacitor tied between PIN VB and PIN VS.

The device operating area as a function of the supply voltage is given in Figure2.

LOW SIDE AND HIGH CONTROL INPUT LOGIC

The Schmitt trigger threshold level of each input is compatible to LSTTL and CMOS down to 3.3 V. Input Schmitt trigger and advanced noise filter provide beneficial noise rejection to short input pulses.
