- using the internal DVDD regulator is strongly recommended for minimum power down current
- active current is based on sensor resolution at full size and at full speed in compression format. For smaller sizes such as 720p or below preview, the total active current will be about half.
- with MIPI function, the active current needs an additional 20mA on DVDD (MIPI power, EVDD, is from DVDD)
- DOVDD active current is based on loading of 10pF and typical compression format output PCLK (48MHz). For YUV output with higher PCLK, or higher loading, DOVDD current can go up.
- at room temperature and typical supply voltages
- based on DOVDD = 1.8V.

6. Driver IC Specification

The AD5820 is a single 10-bit DAC with 100mA output current sink capability. It features an internal reference and operates from a single 2.3V to 5.5V supply. The DAC is controlled via a 2-wire (I2C-compatible) serial interface that operates at clock rates up to 400 kHz.

The AD5820's unique and proprietary Slew Rate Control Modes allow the user to customize the output transient response thereby overcoming mechanical ringing associated with reduced form factor voice coil motors (VCMs).

The AD5820 also incorporates a power-on reset circuit, which ensures that the DAC output powers up to 0V and remains there until a valid write takes place. It has a power-down feature that reduces the current consumption of the device to 1μA maximum.

The AD5820 is designed for auto-focus, image stabilization, and optical zoom applications in camera phones, digital still cameras, and camcorders.

The AD5820 also has many industrial applications, such as controlling temperature, light, and movement, over the range -40°C to +85°C without derating.

The I2C address for the AD5820 is 0x18h.

	20 + 0.1 C _b ³	ns min	
C _b	400	pF max	Capacitive load for each bus line

¹ Guaranteed by design and characterization; not production tested.

² A master device must provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IL(MIN)} of the SCL signal) to bridge the undefined region of SCL's falling edge.

³ C_b is the total capacitance of one bus line in pF. t_r and t_f are measured between 0.3 V_{DD} and 0.7 V_{DD}.

Serial Interface

The AD5820 is controlled using the industry-standard I2C 2-wire serial protocol. Data can be written to or read from the DAC at data rates up to 400 kHz. After a read operation, the contents of the input register are reset to all zeros. The I2C address is 0x18h.

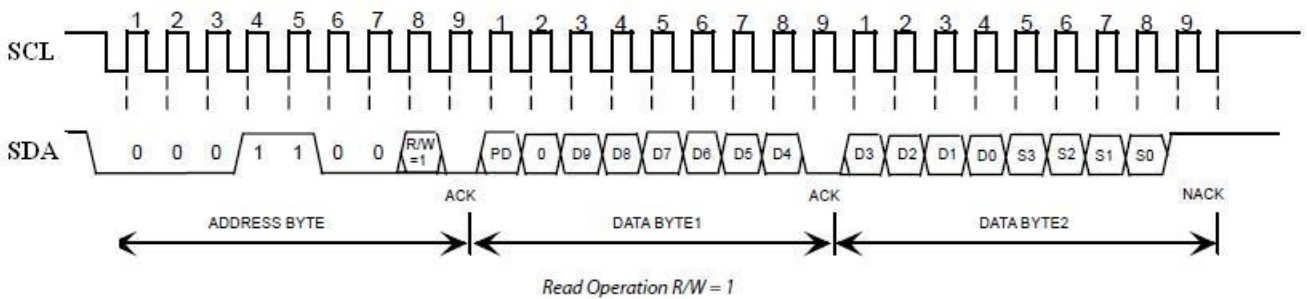

Write Operation

Data is written to the AD5820 high byte first, MSB first, and is shifted into a 16-bit input register. After all data is shifted in, data from the input register is transferred to the DAC register.

Read Operation

During a read operation, data is read in the same bit order.

Data Format

Bit 15, the PD bit is a software power down enable. When set to 1, the output circuitry is disabled and the AD5820 goes into a low power mode. The digital circuitry and I2C interface is still active in this mode. When the PD bit is reset back to zero, the DAC powers up to the value written to the DAC bits at the same time.

Bit 13 to bit 4 are DAC data bits D9 to D0. Bit14 is unused / don't care.

Remark:

1. The definition of the appearance importance class

A: The defect can be found in the finished product, or have obvious visual differences from good products, such as crack, defect and dust, or influence image quality, or are appointed by the customer. We will emphasize these items and check all products.

B: The defect can be found in the finished product and has visual difference from the good one, but will not affect customer's aesthetic judgement.
