BCT2014

0.7uA Low Power, Low Dropout Linear Regulators

GENERAL DESCRIPTION

The BCT2014 series low-power, low-noise, low-dropout, CMOS linear voltage regulators operate from a 2.5V to 15.0V input voltage with 0.7uA low power. They are the perfect choice for low voltage, low power applications. A low ground current makes this part attractive for battery operated power systems. The BCT2014 series also offer ultra low dropout voltage to prolong battery life in portable electronics. Output current minimum limit is 300mA.

These devices feature a shutdown function and are offered in active low with auto discharge. The output voltage is preset to voltages in the range of 1.5V to 5.0V. Other features include a low shutdown current, fold-back current limit.

The BCT2014 is available in Green SOT23-3, SOT23-5, SC70-5, UTDFN1x1-4L and SOT89-3 packages. It operates over an ambient temperature range of -40°C to +85°C.

OVERSTRESS CAUTION

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. Broadchip recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

NOTES:

- $V_{IN} = V_{OUT} (NOMINAL) + 1V$, whichever is greater.
- The dropout voltage is defined as $V_{IN} - V_{OUT}$, when V_{OUT} is 100mV below the value of V_{OUT} for $V_{IN} = V_{OUT} + 1V$.
(Only applicable for $V_{OUT} = +1V$.)
- $V_{EN} = -0.3V$ to V_{IN}

TYPICAL APPLICATION CIRCUIT

NOTES: If has a large Load Transient in the application, recommend using 4.7uF or more in C_{out} .
