Data Sheet

## Description

The Broadcom ${ }^{\circledR}$ HSSR-7110, HSSR-7111, HSSR-7112, HSSR-711E and SMD 5962-9314001, 5962-9314002 are single-channel power MOSFET optocouplers, constructed in eight-pin, hermetic, dual-in-line, ceramic packages. The devices operate exactly like a solid-state relay.

The products are capable of operation and storage over the full military temperature range and can be purchased as a commercial product (HSSR-7110), with full MIL-PRF-38534 Class H testing (HSSR-7111 and HSSR-7112), with MIL-PRF-38534 Class E testing (Class K with exceptions) (HSSR-711E) or from the DLA Standard Microcircuit Drawing (SMD) 5962-93140. Details of the Class E program exceptions are listed here:

1. Nondestructive Bond Pull, Test method 2023 of MIL-STD-883 in device screening is not required.
2. Particle Impact Noise Detection (PIND), Test method 2020 of MIL-STD-883 in device screening and group $C$ testing is not required.
3. Die Shear Strength, Test method 2019 of MIL-STD-883 in group B testing is not required.
4. Internal Water Vapor Content, Test method 1018 of MIL-STD-883 in group $C$ testing is not required.
5. Scanning Electron Microscope (SEM) inspections, Test method 2018 of MIL-STD-883 in element evaluation is not required.

## Features

- Dual marked with device part number and DLA Standard Microcircuit Drawing (SMD)
- ac/dc signal and power switching
- Compact solid-state bidirectional switch
- Manufactured and tested on a MIL-PRF-38534 certified line
- QML-38534, Class H and Class E
- Hermetically sealed 8-pin, dual-in-line package
- Small size and weight
- Performance guaranteed over $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
- Connection A $0.8 \mathrm{~A}, 1.0 \Omega$
- Connection B $1.6 \mathrm{~A}, 0.25 \Omega$
- 1500 Vdc withstand test voltage
- High transient immunity
- 5 Amp output surge current

## Applications

- Military and space
- High reliability systems
- Standard 28 Vdc and 48 Vdc load driver
- Standard 24 Vac load driver
- Aircraft controls
- ac/dc electromechanical and solid-state relay replacement
- I/O modules
- Harsh industrial environments

## CAUTION It is advised that normal static precautions be

 taken in handling and assembly of this component to prevent damage and/or degradation that may be induced by ESD.
## Functional Diagrams

All devices are manufactured and tested on a MIL-PRF-38534 certified line, and Class H and Class E devices are included in the DLA Qualified Manufacturers List, QML-38534 for Hybrid Microcircuits. Each device contains an AIGaAs light-emitting diode optically coupled to a photovoltaic diode stack, which drives two discrete power MOSFETs. The device operates as a solid-state replacement for single-pole, normally open (1 Form A) relay used for general-purpose switching of signals and loads in high reliability applications.

The devices feature logic level input control and very low output on-resistance, making them suitable for both ac and dc loads. Connection A, as shown in the Functional Diagrams, allows the device to switch either ac or dc loads. Connection B, with the polarity and pin configuration as shown, allows the device to switch dc loads only. The advantage of Connection B is that the on-resistance is significantly reduced, and the output current capability increases by a factor of two.
The devices are convenient replacements for mechanical and solid-state relays where high component reliability with standard footprint lead configuration is desirable. Devices may be purchased with a variety of lead bend and plating options. See Selection Guide - Lead Configuration Options table for details. Standard microcircuit drawing (SMD) parts are available for each package and lead style.

The HSSR-7110, HSSR-7111, HSSR-7112, HSSR-711E, and SMD 5962-9314001, 5962-9314002 are designed to switch loads on 28 Vdc power systems. They meet 80 V surge and $\pm 600 \mathrm{~V}$ spike requirements.

CAUTION Maximum Switching Frequency-Care should be taken during repetitive switching of loads so as not to exceed the maximum output current, maximum output power dissipation, maximum case temperature, and maximum junction temperature.

## Selection Guide - Lead Configuration Options

| Avago Technologies Part Number and Options |  |  |  |
| :---: | :---: | :---: | :---: |
| Commercial | HSSR-7110 |  |  |
| MIL-PRF-38534 Class H | HSSR-7111 | HSSR-7112 |  |
| MIL-PRF-38534 Class E |  |  | HSSR-711E |
| Standard Lead Finish ${ }^{\text {a }}$ | Gold Plate | Gold Plate | Gold Plate |
| Solder Dipped ${ }^{\text {b }}$ | Option \#200 | Option-200 | Option -200 |
| Butt Joint/Gold Plate ${ }^{\text {a }}$ | Option \#100 | Option-100 |  |
| Gull Wing/Soldered ${ }^{\text {b }}$ | Option \#300 | Option -300 | Option -300 |
| Crew Cut/Gold Plate ${ }^{\text {a }}$ | Option \#600 | Option -600 |  |
| SMD Part Number |  |  |  |
| Prescript for all below | 5962- | 5962- | 5962- |
| Gold Plate ${ }^{\text {a }}$ | 9314001HPC | 9314002 HPC | 9314001EPC |
| Solder Dipped ${ }^{\text {b }}$ | 9314001HPA | 9314002HPA | 9314001 EPA |
| Butt Joint/Gold Plate ${ }^{\text {a }}$ | 9314001HYC | 9314002 HYC |  |

## Hermetic Optocoupler Options

Note: Dimensions in millimeters (inches).

| Option | Description |
| :---: | :---: |
| 100 | Surface-mountable hermetic optocoupler with leads trimmed for butt joint assembly. This option is available on Commercial, Class H and E product. |
| 200 | Lead finish is solder dipped rather than gold plated. This option is available on Commercial, Class H and E product. DLA Drawing (SMD) part numbers contain provisions for lead finish. |
| 300 | Surface-mountable hermetic optocoupler with leads cut and bent for gull wing assembly. This option is available on Commercial, Class H and E product. This option has solder dipped leads. |
| 600 | Surface-mountable hermetic optocoupler with leads trimmed for butt joint assembly. This option is available on Commercial, Class H and E product. |

## Absolute Maximum Ratings

| Parameter | Symbol | Min | Max | Unit |
| :--- | :---: | :---: | :---: | :---: |
| Storage Temperature Range | $\mathrm{T}_{\mathrm{S}}$ | -65 | +150 | ${ }^{\circ} \mathrm{C}$ |
| Operating Ambient Temperature | $\mathrm{T}_{\mathrm{A}}$ | -55 | +125 | ${ }^{\circ} \mathrm{C}$ |
| Junction Temperature | $\mathrm{T}_{\mathrm{J}}$ | - | +150 | ${ }^{\circ} \mathrm{C}$ |
| Operating Case Temperature ${ }^{\mathrm{a}}$ | $\mathrm{T}_{\mathrm{C}}$ | - | +145 | ${ }^{\circ} \mathrm{C}$ |
| Lead Solder Temperature |  | - | 260 for 10 s | ${ }^{\circ} \mathrm{C}$ |
| Average Input Current | $\mathrm{I}_{\mathrm{F}}$ | - | 20 | mA |
| Peak Repetitive Input Current <br> (Pulse Width < 100 ms; duty cycle < 50\%) | $\mathrm{I}_{\mathrm{FPK}}$ | - | 40 | mA |
| Peak Surge Input Current <br> (Pulse Width < 0.2 ms; duty cycle < 0.1\%) | $\mathrm{I}_{\text {FPK surge }}$ | - | 100 | mA |
| Reverse Input Voltage | $\mathrm{V}_{\mathrm{R}}$ | - | 5 | V |
| Average Output Current (See Figure 2.) |  |  |  |  |
| Connection A <br> Connection B | $\mathrm{I}_{\mathrm{O}}$ | - | 0.8 | A |
| Single Shot Output Current (See Figure 3.) |  |  |  |  |
| Connection A (Pulse width < 10 ms) |  |  |  |  |
| Connection B (Pulse width <10 ms) |  |  |  |  |

a. Maximum junction to case thermal resistance for the device is $15^{\circ} \mathrm{C} / \mathrm{W}$, where case temperature, $\mathrm{T}_{\mathrm{C}}$, is measured at the center of the package bottom.
b. For rating, see Figure 4. The output power $\mathrm{P}_{\mathrm{O}}$ rating curve is obtained when the part is handling the maximum average output current $\mathrm{I}_{\mathrm{O}}$ as shown in Figure 2 .

## Recommended Operating Conditions

| Parameter | Symbol | Min | Max | Unit |
| :--- | :---: | :---: | :---: | :---: |
| Input Current (on) $^{\mathrm{a}}$ | $\mathrm{I}_{\mathrm{F}(\mathrm{ON})}$ | 5 | 20 | mA |
| Input Current (on) ${ }^{\mathrm{b}}$ | $\mathrm{I}_{\mathrm{F}(\mathrm{ON})}$ | 10 | 20 | mA |
| Input Voltage (off) | $\mathrm{V}_{\mathrm{F}(\mathrm{OFF})}$ | 0 | 0.6 | V |
| Operating Temperature | $\mathrm{T}_{\mathrm{A}}$ | -55 | +125 | ${ }^{\circ} \mathrm{C}$ |

a. Applies to HSSR-7112 and 5962-9314002Hxx devices only.
b. Applies to HSSR-7110, HSSR-7111, HSSR-711E, 5962-9314001Hxx, and 5962-9314001Exx devices only.

## Electrical Specifications

$\mathrm{T}_{\mathrm{A}}=-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$, unless otherwise specified.

a. $\quad \mathrm{V}_{\mathrm{OS}}$ is a function of $\mathrm{I}_{\mathrm{F}}$, and is defined between pins 5 and 8 , with pin 5 as the reference. $\mathrm{V}_{\mathrm{OS}}$ must be measured in a stable ambient (free of temperature gradients).
b. Zero-bias capacitance measured between the LED anode and cathode.
c. Device considered a two-terminal device: pins 1 through 4 shorted together and pins 5 through 8 shorted together.
d. For a faster turn-on time, the optional peaking circuit shown in Figure 1 can be implemented.

NOTE:
IN ORDER TO DETERMINE $V_{\text {OUT }}$ CORRECTLY, THE CASE TO AMBIENT THERMAL IMPEDANCE MUST
BE MEASURED FOR THE BURN-IN BOARDS TO BE USED. THEN, KNOWING $\theta$, DETERMINE THE
CORRECT OUTPUT CURRENT PER FIGURES 2 AND 4 TO INSURE THAT THE DEVICE MEETS THE
DERATING REQUIREMENTS AS SHOWN.

## Applications Information

## Thermal Model

The steady-state thermal model for the HSSR-711x is shown in Figure 21. The thermal resistance values given in this model can be used to calculate the temperatures at each node for a given operating condition. The thermal resistances between the LED and other internal nodes are very large in comparison with the other terms and are omitted for simplicity. The components do, however, interact indirectly through $\theta_{C A}$, the case-to-ambient thermal resistance. All heat generated flows through $\theta_{C A}$, which raises the case temperature $T_{C}$ accordingly. The value of $\theta_{C A}$ depends on the conditions of the board design and is, therefore, determined by the designer.

The maximum value for each output MOSFET junction-to-case thermal resistance is specified as $15^{\circ} \mathrm{C} / \mathrm{W}$. The thermal resistance from FET driver junction-to-case is also $15^{\circ} \mathrm{C} / \mathrm{W} / \mathrm{W}$. The power dissipation in the FET driver, however, is negligible in comparison to the MOSFETs.

Figure 21 Thermal Model

$\mathrm{T}_{\mathrm{je}}=$ LED JUNCTION TEMPERATURE
$\mathrm{T}_{\mathrm{jf} 1}=$ FET 1 JUNCTION TEMPERATURE
$\mathrm{T}_{\mathrm{j} f 2}=$ FET 2 JUNCTION TEMPERATURE

$\mathrm{T}_{\mathrm{A}}=$ AMBIENT TEMPERATURE (MEASURED 6" AWAY FROM THE PACKAGE)
$\theta_{\text {CA }}=$ CASE-TO-AMBIENT THERMAL RESISTANCE

ALL THERMAL RESISTANCE VALUES ARE IN ${ }^{\circ}$ / W

## On-Resistance and Rating Curves

The output on-resistance, $\mathrm{R}_{\mathrm{ON}}$, specified in this data sheet, is the resistance measured across the output contact when a pulsed current signal $\left(\mathrm{I}_{\mathrm{O}}=800 \mathrm{~mA}\right)$ is applied to the output pins. The use of a pulsed signal ( $\leq 30 \mathrm{~ms}$ ) implies that each junction temperature is equal to the ambient and case temperatures. The steady-state resistance, $\mathrm{R}_{\mathrm{SS}}$, on the other hand, is the value of the resistance measured across the output contact when a DC current signal is applied to the output pins for a duration sufficient to reach thermal equilibrium. $\mathrm{R}_{\mathrm{SS}}$ includes the effects of the temperature rise of each element in the thermal model. Rating curves are shown in Figure 2 and Figure 4. Figure 2 specifies the maximum average output current allowable for a given ambient temperature. Figure 4 specifies the output power dissipation allowable for a given ambient temperature. Above $55^{\circ} \mathrm{C}$ (for $\theta_{\mathrm{CA}}=80^{\circ} \mathrm{C} / \mathrm{W}$ ) and $107^{\circ} \mathrm{C}$ (for $\theta_{\mathrm{CA}}=40^{\circ} \mathrm{C} / \mathrm{W} / \mathrm{W}$ ), the maximum allowable output current and power dissipation are related by the expression $\mathrm{R}_{\mathrm{SS}}=\mathrm{P}_{\mathrm{O}(\text { max })} /\left(\mathrm{l}_{\mathrm{O}(\text { max })}\right)^{2}$ from which $\mathrm{R}_{\mathrm{SS}}$ can be calculated. Staying within the safe area assures that the steady-state junction temperatures remain less than $150^{\circ} \mathrm{C}$. As an example, for $T_{A}=95^{\circ} \mathrm{C}$ and $\theta_{C A}=80^{\circ} \mathrm{C} / \mathrm{W}$, Figure 2 shows that the output current should be limited to less than 610 mA . A check with Figure 4 shows that the output power dissipation at $\mathrm{T}_{\mathrm{A}}=95^{\circ} \mathrm{C}$ and $\mathrm{I}_{\mathrm{O}}=610 \mathrm{~mA}$, is limited to less than 0.35 W . This yields an $\mathrm{R}_{\mathrm{SS}}$ of $0.94 \Omega$.

## Design Considerations for Replacement of Electromechanical Relays

The HSSR-711x family can replace electromechanical relays with comparable output voltage and current ratings. The following design issues need to be considered in the replacement circuit.

## Input Circuit

The drive circuit of the electromechanical relay coil needs to be modified so that the average forward current driving the LED of the HSSR-711x does not exceed 20 mA . A nominal forward drive current of 10 mA is recommended. A recommended drive circuit with 5V VCC and CMOS logic gates is shown in Figure 1. If higher VCC voltages are used, adjust the current limiting resistor to a nominal LED forward current of 10 mA . One important consideration to note is that when the LED is turned off, no more than 0.6 V forward bias should be applied across the LED. Even a few microamps of current may be sufficient to turn on the HSSR- 711x, although it may take a considerable time. The drive circuit should maintain at least 5 mA of LED current during the ON condition. If the LED forward current is less than the 5 mA level, it causes the HSSR-711x to turn on with a longer delay. In addition, the power dissipation in the output power MOSFETs increases, which, in turn, may violate the power dissipation guidelines and affect the reliability of the device.

## Output Circuit

Unlike with electromechanical relays, when considering solid-state relays, the designer should pay careful attention to the output on-resistance. The previous section, On-Resistance and Rating Curves, describes the issues that need to be considered. In addition, for strictly dc applications, the designer has an advantage using Connection $B$, which has twice the output current rating as Connection A. Furthermore, for dc-only applications, with Connection B the on-resistance is considerably less when compared to Connection A.

Output over-voltage protection is yet another important design consideration when replacing electromechanical relays with the HSSR-711x. The output power MOSFETs can be protected using Metal oxide varistors (MOVs) or TransZorbs against voltage surges that exceed the 90 V output withstand voltage rating. Examples of sources of voltage surges are inductive load kickbacks, lightning strikes, and electrostatic voltages that exceed the specifications on this data sheet. For more information on output load and protection, refer to Application Note 1047.
