

ACNT-H313

2.5A Output Current IGBT Gate Drive Optocoupler in 15-mm Stretched SO8 Package

Description

The Broadcom[®] ACNT-H313 contains an LED, which is optically coupled to an integrated circuit with a power output stage. This optocoupler is ideally suited for driving power IGBTs and MOSFETs used in motor control inverter applications. The high operating voltage range of the output stage provides the drive voltages required by gate-controlled devices. The voltage and high peak output current supplied by this optocoupler can be used to IGBT directly. For IGBTs with higher ratings, this optocoupler can be used to drive a discrete power stage, which drives the IGBT gate. The ACNT-H313 has the highest insulation voltage of $V_{IORM} = 2262 V_{PEAK}$ in the IEC/EN/DIN EN 60747-5-5.

Features

- 2.5A maximum peak output current
- 2.0A minimum peak output current
- 500-ns maximum propagation delay
- 350-ns maximum propagation delay difference
- 40-kV/ μ s minimum Common Mode Rejection (CMR) at $V_{CM} = 2000V$
- $I_{CC} = 5.0$ -mA maximum supply current
- Under Voltage Lock-Out protection (UVLO) with hysteresis
- Wide operating V_{CC} range: 15V to 30V
- Industrial temperature range: $-40^{\circ}C$ to $105^{\circ}C$
- Safety approvals
 - UL Recognized 7500 V_{RMS} for 1 min
 - CSA
 - IEC/EN/DIN EN 60747-5-5 $V_{IORM} = 2262 V_{PEAK}$

Applications

- High power system – 690 V_{AC} drives
- IGBT/MOSFET gate drive
- AC and brushless DC motor drives
- Renewable energy inverters
- Industrial inverters
- Switching power supplies

CAUTION! Take normal static precautions in handling and assembly of this component to prevent damage and/or degradation that may be induced by ESD. The components featured in this data sheet are not to be used in military or aerospace applications or environments. The component is also not AEC-Q100 qualified and not recommended for automotive applications.

Functional Diagram

NOTE: NC denotes Not Connected, and a 0.1- μ F bypass capacity must be connected between pins V_{CC} and V_{EE} .

NOTE: These optocouplers are suitable for “safe electrical isolation” only within the safety limit data. Maintenance of the safety data shall be ensured by means of protective circuits. Surface mount classification is Class A in accordance with CECC 00802.

Table 2. Insulation and Safety Related Specifications

| Parameter | Symbol | ACNT-H313 | Units | Conditions |
|---|--------|-----------|-------|--|
| Minimum External Air Gap (Clearance) | L(101) | 14.2 | mm | Measured from input terminals to output terminals, shortest distance through air. |
| Minimum External Tracking (Creepage) | L(102) | 15 | mm | Measured from input terminals to output terminals, shortest distance path along body. |
| Minimum Internal Plastic Gap (Internal Clearance) | | 0.5 | mm | Through insulation distance conductor to conductor, usually the straight line distance thickness between the emitter and detector. |
| Tracking Resistance (Comparative Tracking Index) | CTI | > 300 | V | DIN IEC 112/VDE 0303 Part 1 |
| Isolation Group | | IIIa | | Material Group (DIN VDE 0110, 1/89, Table 1) |

All Broadcom data sheets report the creepage and clearance inherent to the optocoupler component itself. These dimensions are needed as a starting point for the equipment designer when determining the circuit insulation requirements. However, once mounted on a printed circuit board, minimum creepage and clearance requirements must be met as specified for individual equipment standards. For creepage, the shortest distance path along the surface of a printed circuit board between the solder fillets of the input and output leads must be considered (the recommended land pattern does not necessarily meet the minimum creepage of the device). There are recommended techniques such as grooves and ribs which may be used on a printed circuit board to achieve desired creepage and clearances. Creepage and clearance distances will also change depending on factors, such as pollution degree and insulation level.

- Pulse Width Distortion (PWD) is defined as $|t_{\text{PHL}} - t_{\text{PLH}}|$ for any given device.
- The difference between t_{PHL} and t_{PLH} between any two ACNT-H313 parts under the same test condition.
- t_{PSK} is equal to the worst-case difference in t_{PHL} or t_{PLH} that will be seen between units at any given temperature and specified test conditions.
- Pins 1 and 4 must be connected to LED common. Split resistor network in the ratio 1.5:1 with 215W at the anode and 140W at the cathode.
- Common mode transient immunity in the high state is the maximum tolerable dV_{CM}/dt of the common mode pulse, V_{CM} , to assure that the output will remain in the high state (that is, $V_O > 15.0\text{V}$).
- Common mode transient immunity in a low state is the maximum tolerable dV_{CM}/dt of the common mode pulse, V_{CM} , to assure that the output will remain in a low state (that is, $V_O < 1.0\text{V}$).

- The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating, refer to your equipment level safety specification or Broadcom Application Note 1074, *Optocoupler Input-Output Endurance Voltage*.
- In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 9000 V_{RMS}$ for 1 second (leakage detection current limit, $I_{I-O} \leq 5 \mu\text{A}$).
- The device is considered to be a two-terminal device: pins 1, 2, 3, and 4 shorted together and pins 5, 6, 7, and 8 shorted together.
- The device was mounted on a high conductivity test board as per JEDEC 51-7.

Applications Information

Selecting the Gate Resistor (R_g) to Minimize IGBT Switching Losses

Step 1: Calculate R_g minimum from the IOL peak specification. The IGBT and R_g in [Figure 24](#) can be analyzed as a simple RC circuit with a voltage supplied by the ACNT-H313.

$$\begin{aligned} R_g &\geq \frac{V_{CC} - V_{EE} - V_{OL}}{I_{OLPEAK}} \\ &= \frac{15 + 5 - 2}{2.5} \\ &= 7.2 \Omega \cong 8 \Omega \end{aligned}$$

The V_{OL} value of 2V in the previous equation is a conservative value of V_{OL} at the peak current of 2.5A (see [Figure 6](#)). At lower R_g values, the voltage supplied by the ACNT-H313 is not an ideal voltage step. This results in lower peak currents (more margin) than predicted by this analysis. When negative gate drive is not used V_{EE} in the previous equation is equal to 0V.

Figure 24: ACNT-H313 Typical Application Circuit

Step 2: Check the ACNT-H313 Power Dissipation and Increase R_g if necessary. The ACNT-H313 total power dissipation (P_T) is equal to the sum of the emitter power (P_E) and the output power (P_O).

$$P_T = P_E + P_O$$

$$P_E = I_F \cdot V_F \cdot \text{DutyCycle}$$

$$P_O = P_{O(\text{BIAS})} + P_{O(\text{SWITCHING})} = I_{CC} \cdot V_{CC} + E_{SW}(R_g, Q_g) \cdot f$$

| P_E Parameter | Description |
|-----------------|------------------------|
| I_F | LED current |
| V_F | LED-on voltage |
| Duty Cycle | Maximum LED duty cycle |

| P_O Parameter | Description |
|--------------------|---|
| I_{CC} | Supply current |
| V_{CC} | Positive supply voltage |
| V_{EE} | Negative supply voltage |
| $E_{SW}(R_g, Q_g)$ | Energy dissipated in the ACNT-H313 for each IGBT switching cycle (see Figure 25) |
| f | Switching frequency |

For the circuit in [Figure 24](#) with I_F (worst case) = 12 mA, $R_g = 8\Omega$, Maximum Duty Cycle = 80%, $Q_g = 500$ nC, $f = 20$ kHz, and T_A maximum = 85°C.

$$P_F = 12 \text{ mA} \cdot 1.8 \text{ V} \cdot 0.8 = 17.3 \text{ mW}$$

$$P_O = 4.25 \text{ mA} \cdot 20 \text{ V} + 5.2 \text{ } \mu\text{J} \cdot 20 \text{ kHz}$$

$$= 85 \text{ mW} + 104 \text{ mW}$$

$$= 189 \text{ mW}$$

$$< 800 \text{ mW (} P_{O(\text{MAX})} \text{ @ } 85^\circ\text{C)}$$

The value of 4.25 mA for I_{CC} in the previous equation was obtained by derating the I_{CC} maximum of 5 mA (which occurs at -40°C) to I_{CC} max at 85°C (see [Figure 7](#)).

Because P_O for this case is smaller than $P_{O(\text{MAX})}$, R_g of 8Ω can be used.

Ambient Temperature: Junction-to-Ambient Thermal Resistances were measured approximately 1.25 cm above the optocoupler at ~23°C in still air.

| Thermal Resistance | °C/W |
|--------------------|------|
| R_{11} | 87 |
| R_{12} | 23 |
| R_{21} | 30 |
| R_{22} | 47 |

This thermal model assumes the device is soldered onto a high conductivity board as per JEDEC 51-7. The temperature at the LED and Detector junctions of the optocoupler can be calculated using the following equations:

$$T_1 = (R_{11} \times P_1 + R_{12} \times P_2) + T_A \text{ -- (1)}$$

$$T_2 = (R_{21} \times P_1 + R_{22} \times P_2) + T_A \text{ -- (2)}$$

Using the given thermal resistances and thermal model formula in this data sheet, we can calculate the junction temperature for both LED and the output detector. Both junction temperatures should be within the absolute maximum rating of 125°C.
