

# ACPL-312T

## Automotive IGBT Gate Drive Optocoupler with R<sup>2</sup>Coupler™ Isolation and 2.5 Amp Output Current

### Data Sheet

**Lead (Pb) Free**  
RoHS 6 fully compliant

RoHS 6 fully compliant options available;  
-xxxE denotes a lead-free product

#### Description

The ACPL-312T device contains an AlGaAs LED. The LED is optically coupled to an integrated circuit with a power output stage. This automotive optocoupler is ideally suited for driving power IGBTs and MOSFETs used in automotive motor control inverter and DC-DC converters applications. The high operating voltage range of the output stage provides the drive voltages required by gate controlled devices. The voltage and current supplied by these optocouplers make them ideally suited for directly driving IGBTs with ratings up to 1200 V/100 A. For IGBTs with higher ratings, the ACPL-312T series can be used to drive a discrete power stage which drives the IGBT gate.

Avago R<sup>2</sup>Coupler isolation products provide the reinforced insulation and reliability needed for critical in automotive and high temperature industrial applications.

#### Functional Diagram

#### TRUTH TABLE

LED	V <sub>CC</sub> - V <sub>EE</sub> "POSITIVE GOING" (i.e., TURN-ON)	V <sub>CC</sub> - V <sub>EE</sub> "NEGATIVE GOING" (i.e., TURN-OFF)	V <sub>O</sub>
OFF	0 - 30 V	0 - 30 V	LOW
ON	0 - 11 V	0 - 9.5 V	LOW
ON	11 - 13.5 V	9.5 - 12 V	TRANSITION
ON	13.5 - 30 V	12 - 30 V	HIGH

A 0.1 μF bypass capacitor must be connected between pins 5 and 8.

#### Features

- 2.5 A maximum peak output current
- 2.0 A minimum peak output current
- 25 kV/μs minimum Common Mode Rejection (CMR) at V<sub>CM</sub> = 1500 V
- 0.5 V maximum low level output voltage (V<sub>OL</sub>) - Eliminates need for negative gate drive
- I<sub>CC</sub> = 5 mA maximum supply current
- Under Voltage Lock-Out protection (UVLO) with hysteresis
- Wide operating V<sub>CC</sub> range: 15 to 30 Volts
- 500 ns maximum switching speeds
- Automotive temperature range:
  - -40°C to 125°C
- Qualified to AEC-Q100 Test Guidelines
- Safety Approval:
  - UL Recognized 3750 Vrms for 1 min. (5kV for option x20E available upon request).
  - CSA
  - IEC/EN/DIN EN 60747-5-2

#### Applications

- Automotive Motor/DC-DC Converter
- Automotive Isolated IGBT/MOSFET Gate Drive
- AC and Brushless DC Motor Drives
- Industrial Inverters Systems
- Switch mode power supplies

**CAUTION:** It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

## Ordering Information

Part Number	Options		Surface Mount	Gullwing	Tape & Reel	Quantity
	RoHS Compliant	Package				
ACPL-312T	-000E	DIP 8				50 per tube
	-300E	DIP 8	X	X		50 per tube
	-500E	Gullwing	X	X	X	1000 per reel

Note:- option x20E for UL1577 5000Vrms for 1minute will be offered upon request

To order, choose a part number from the part number column and combine with the desired option from the option column to form an order entry.

### Example 1:

ACPL-312T-500E to order product of gullwing DIP-8 package in Tape and Reel packaging with RoHS compliant.

### Example 2:

ACPL-312T-000E to order product of DIP-8 package in tube packaging with RoHS compliant.

Option datasheets are available. Contact your Avago sales representative or authorized distributor for information.

## Package Outline Drawings

### ACPL-312T-000E standard DIP8 package

## Gull Wing Surface Mount Option 300E and 500E

## Recommended Pb-Free IR Profile

Notes:  
The time from 25 °C to peak temperature = 8 minutes max.  
 $T_{smax}$  = 200 °C,  $T_{smin}$  = 150 °C  
Non-halide flux should be used

## Regulatory Information

The ACPL-312T-000E is approved by the following organizations:

### UL

Recognized under UL 1577, component recognition program up to  $V_{ISO} = 3750 V_{RMS}$

### CSA

CSA Component Acceptance Notice #5, File CA88324.

### IEC/EN/DIN EN 60747-5-2

IEC 60747-5-2:1997 + A1:2002

EN 60747-5-2:2001 + A1:2002

DIN EN 60747-5-2 (VDE 0884Teil 2):2003-01

## Insulation and Safety Related Specifications

Parameter	Symbol	Value	Units	Conditions
Minimum External Air Gap (Clearance)	L(101)	7.1	mm	Measured from input terminals to output terminals, shortest distance through air.
Minimum External Tracking (Creepage)	L(102)	7.4	mm	Measured from input terminals to output terminals, shortest distance path along body.
Minimum Internal Plastic Gap (Internal Clearance)		0.08	mm	Through insulation distance conductor to conductor, usually the straight line distance thickness between the emitter and detector.
Tracking Resistance (Comparative Tracking Index)	CTI	>175	Volts	DIN IEC 112/VDE 0303 Part 1
Isolation Group (DIN VDE0109)		IIIa		Material Group (DIN VDE 0110)

All Avago data sheets report the creepage and clearance inherent to the optocoupler component itself. These dimensions are needed as a starting point for the equipment designer when determining the circuit insulation requirements. However, once mounted on a printed circuit board, minimum creepage and clearance requirements must be met as specified for individual equipment standards. For creepage, the shortest distance path along the

surface of a printed circuit board between the solder fillets of the input and output leads must be considered. There are recommended techniques such as grooves and ribs which may be used on a printed circuit board to achieve desired creepage and clearances. Creepage and clearance distances will also change depending on factors such as pollution degree and insulation level.

## IEC/EN/DIN EN 60747-5-2 Insulation Related Characteristics

\*\*The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refers to your equipment level safety specification or Avago Application Note 1074 entitled "Optocoupler Input-Output Endurance Voltage."

### Notes:

- Derate linearly above 70°C free-air temperature at a rate of 0.0727 mA/°C. †
- Maximum pulse width = 10 μs, maximum duty cycle = 0.2%. This value is intended to allow for component tolerances for designs with IO peak minimum = 2.0 A. See Applications section for additional details on limiting I<sub>OH</sub> peak.
- Derate linearly above 70°C free-air temperature at a rate of 5.0 mW/°C.
- Derate linearly above 70°C free-air temperature at a rate of 5.0 mW/°C. The maximum LED junction temperature should not exceed 150°C.
- Maximum pulse width = 50 μs, maximum duty cycle = 0.5%.
- In this test V<sub>OH</sub> is measured with a dc load current. When driving capacitive loads V<sub>OH</sub> will approach V<sub>CC</sub> as I<sub>OH</sub> approaches zero amps.
- Maximum pulse width = 1 ms, maximum duty cycle = 20%. 8. In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage ≥4500 Vrms for 1 second (leakage detection current limit, II-O ≤ 5 μA).
- In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage ≥4500 Vrms for 1 second (leakage detection current limit, II-O ≤ 5 μA).
- In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage ≥6000 Vrms for 1 second (leakage detection current limit, II-O ≤ 5 μA).
- Device considered a two-terminal device: pins 1, 2, 3, and 4 shorted together and pins 5, 6, 7, and 8 shorted together.
- The difference between t<sub>PHL</sub> and t<sub>PLH</sub> between any two ACPL-312T parts under the same test condition.
- Pins 1 and 4 need to be connected to LED common.
- Common mode transient immunity in the high state is the maximum tolerable dV<sub>CM</sub>/dt of the common mode pulse, V<sub>CM</sub>, to assure that the output will remain in the high state (i.e., V<sub>O</sub> > 15.0 V).
- Common mode transient immunity in a low state is the maximum tolerable dV<sub>CM</sub>/dt of the common mode pulse, V<sub>CM</sub>, to assure that the output will remain in a low state (i.e., V<sub>O</sub> < 1.0 V).
- This load condition approximates the gate load of a 1200 V/75A IGBT.
- Pulse Width Distortion (PWD) is defined as |t<sub>PHL</sub>-t<sub>PLH</sub>| for any given device.

## Applications Information

### Eliminating Negative IGBT Gate Drive ACPL-312T

To keep the IGBT firmly off, the ACPL-312T has a very low maximum  $V_{OL}$  specification of 0.5 V. The ACPL-312T realizes this very low  $V_{OL}$  by using a DMOS transistor with 1  $\Omega$  (typical) on resistance in its pull down circuit. When the ACPL-312T is in the low state, the IGBT gate is shorted to the emitter by  $R_g + 1 \Omega$ . Minimizing  $R_g$  and the lead inductance from the ACPL-312T to the IGBT gate and emitter (possibly by mounting the ACPL-312T on a small PC board directly above the IGBT) can eliminate the need for nega-

tive IGBT gate drive in many applications as shown in Figure 25. Care should be taken with such a PC board design to avoid routing the IGBT collector or emitter traces close to the ACPL-312T input as this can result in unwanted coupling of transient signals into the ACPL-312T and degrade performance. (If the IGBT drain must be routed near the ACPL-312T input, then the LED should be reverse-biased when in the off state, to prevent the transient signals coupled from the IGBT drain from turning on the ACPL-312T).

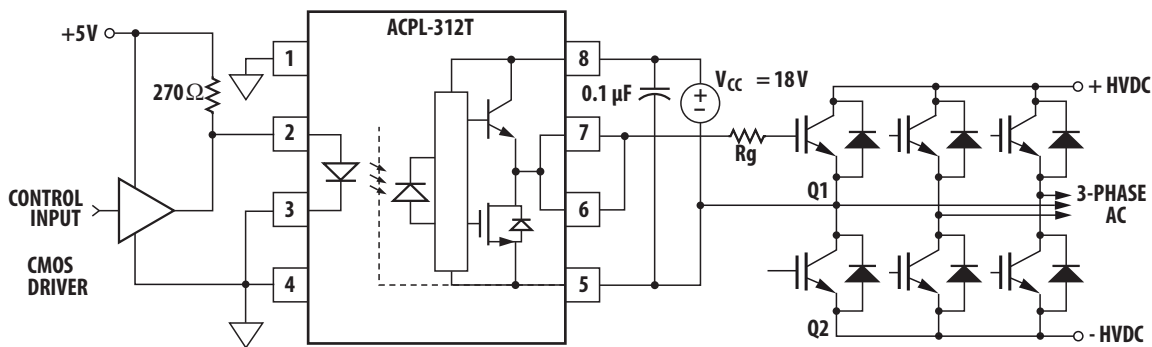

Figure 25. Recommended LED drive and application circuit.

### Selecting the Gate Resistor ( $R_g$ ) to Minimize IGBT Switching

#### Losses.

**Step 1:** Calculate  $R_g$  Minimum from the  $I_{OL}$  Peak Specification. The IGBT and  $R_g$  in Figure 26 can be analyzed as a simple RC circuit with a voltage supplied by the HCPL-3120.

$$R_g \geq \frac{(V_{CC} - V_{EE} - V_{OL})}{I_{OLPEAK}} = \frac{(V_{CC} - V_{EE} - 2V)}{I_{OLPEAK}}$$

$$= \frac{(15 + 5 - 2)}{2.5A} \quad R_g = 7.2\Omega \cong 8\Omega$$

The  $V_{OL}$  value of 2 V in the previous equation is a conservative value of  $V_{OL}$  at the peak current of 2.5A (see Figure 6). At lower  $R_g$  values the voltage supplied by the ACPL-312T is not an ideal voltage step. This results in lower peak currents (more margin) than predicted by this analysis. When negative gate drive is not used  $V_{EE}$  in the previous equation is equal to zero volts.

Figure 26. ACPL-312T typical application circuit with negative IGBT gate drive.

**Step 2: Check the ACPL-312T Power Dissipation and Increase R<sub>g</sub> if Necessary.**

The ACPL-312T total power dissipation (P<sub>T</sub>) is equal to the sum of the emitter power (P<sub>E</sub>) and the output power (P<sub>O</sub>):

$$P_T = P_E + P_O$$

$$P_E = I_F \cdot V_F \cdot \text{Duty Cycle}$$

$$P_O = P_{O(\text{BIAS})} + P_{O(\text{SWITCHING})}$$

$$= I_{CC} \cdot (V_{CC} - V_{EE}) + E_{SW}(R_G, Q_G) \cdot f$$

For the circuit in Figure 26 with I<sub>F</sub> (worst case) = 16 mA, R<sub>g</sub> = 8 Ω, Max Duty Cycle = 80%, Q<sub>g</sub> = 500 nC, f = 20 kHz and T<sub>A</sub> max = 85°C:

$$P_E = 16 \text{ mA} \cdot 1.8 \text{ V} \cdot 0.8 = 23 \text{ mW}$$

$$P_O = 4.25 \text{ mA} \cdot 20 \text{ V} + 5.2 \mu\text{J} \cdot 20 \text{ kHz}$$

$$= 85 \text{ mW} + 104 \text{ mW}$$

$$= 189 \text{ mW}$$

$$> 178 \text{ mW } (P_{O(\text{MAX})} \text{ @ } 85^\circ\text{C})$$

$$= 250 \text{ mW} - 15^\circ\text{C} \cdot 4.8 \text{ mW}/^\circ\text{C}$$

The value of 4.25 mA for I<sub>CC</sub> in the previous equation was obtained by derating the I<sub>CC</sub> max of 5 mA (which occurs at -40°C) to I<sub>CC</sub> max at 125°C (see Figure 7). Since P<sub>O</sub> for this case is greater than P<sub>O(MAX)</sub>, R<sub>g</sub> must be increased to reduce the ACPL-312T power dissipation.

$$P_{O(\text{SWITCHING MAX})} = P_{O(\text{MAX})} - P_{O(\text{BIAS})}$$

$$= 178 \text{ mW} - 85 \text{ mW}$$

$$= 93 \text{ mW}$$

$$E_{SW(\text{MAX})} = \frac{P_{O(\text{SWITCHING MAX})}}{f}$$

$$= \frac{93 \text{ mW}}{20 \text{ kHz}}$$

$$= 4.65 \mu\text{W}$$

For Q<sub>g</sub> = 500 nC, from Figure 27, a value of E<sub>SW</sub> = 4.65 μW gives a R<sub>g</sub> = 10.3 Ω.

P <sub>E</sub> Parameter	Description
I <sub>F</sub>	LED Current
V <sub>F</sub>	LED On Voltage
Duty Cycle	Maximum LED Duty Cycle

P <sub>O</sub> Parameter	Description
I <sub>CC</sub>	Supply Current
V <sub>CC</sub>	Positive Supply Voltage
V <sub>EE</sub>	Energy Dissipated in the ACPL-312T for each IGBT Switching Cycle (See Figure 27)
E <sub>SW</sub> (R <sub>G</sub> , Q <sub>G</sub> )	
f	Switching Frequency

Figure 27. Energy dissipated in the ACPL-312T for each IGBT switching cycle.

**Thermal Model**

The steady state thermal model for the ACPL-312T is shown in Figure 28. The thermal resistance values given in this model can be used to calculate the temperatures at each node for a given operating condition. As shown by the model, all heat generated flows through θ<sub>CA</sub> which raises the case temperature T<sub>C</sub> accordingly. The value of θ<sub>CA</sub> depends on the conditions of the board design and is, therefore, determined by the designer. The value of θ<sub>CA</sub> = 83°C/W was obtained from thermal measurements using a 2.5 x 2.5 inch PC board, with small traces (no ground plane), a single ACPL-312T soldered into the center of the board and still air. The absolute maximum power dissipation de-rating specifications assume a θ<sub>CA</sub> value of 83°C/W. From the thermal mode in Figure 28 the LED and detector IC junction temperatures can be expressed as:

$$T_{JE} = P_E \cdot (\theta_{LD} \parallel \theta_{DC}) + \theta_{CA}$$

$$+ P_D \cdot \left( \frac{\theta_{LC} \cdot \theta_{DC}}{\theta_{LC} + \theta_{DC} + \theta_{LD}} + \theta_{CA} \right) + T_A$$

$$T_{JD} = P_E \cdot \left( \frac{\theta_{LC} \cdot \theta_{DC}}{\theta_{LC} + \theta_{DC} + \theta_{LD}} + \theta_{CA} \right)$$

$$+ P_D \cdot (\theta_{DC} \parallel \theta_{LD}) + \theta_{LC} + T_A$$

Inserting the values for  $\theta_{LC}$  and  $\theta_{DC}$  shown in Figure 28 gives:

$$T_{JE} = P_E \cdot (256^\circ\text{C/W} + \theta_{CA}) + P_D \cdot (57^\circ\text{C/W} + \theta_{CA}) + T_A$$

$$T_{JD} = P_E \cdot (57^\circ\text{C/W} + \theta_{CA}) + P_D \cdot (111^\circ\text{C/W} + \theta_{CA}) + T_A$$

- $T_{JE}$  = LED junction temperature
- $T_{JD}$  = detector IC junction temperature
- $T_C$  = case temperature measured at the center of the package bottom
- $\theta_{LC}$  = LED-to-case thermal resistance
- $\theta_{LD}$  = LED-to-detector thermal resistance
- $\theta_{DC}$  = detector-to-case thermal resistance
- $\theta_{CA}$  = case-to-ambient thermal resistance
- \* $\theta_{CA}$  will depend on the board design and the placement of the part.

Figure 28. Thermal model.

### LED Drive Circuit Considerations for Ultra High CMR Performance.

Without a detector shield, the dominant cause of optocoupler CMR failure is capacitive coupling from the input side of the optocoupler, through the package, to the detector IC as shown in Figure 29. The ACPL-312T improves CMR performance by using a detector IC with an optically transparent Faraday shield, which diverts the capacitively coupled current away from the sensitive IC circuitry. However, this shield does not eliminate the capacitive coupling between the LED and optocoupler pins 5-8 as shown in

Figure 29. Optocoupler input to output capacitance model for unshielded optocouplers.

For example, given  $P_E = 30\text{ mW}$ ,  $P_D = 230\text{ mW}$ ,  $T_A = 100^\circ\text{C}$  and  $\theta_{CA} = 83^\circ\text{C/W}$ :

$$T_{JE} = P_E \cdot 339^\circ\text{C/W} + P_D \cdot 140^\circ\text{C/W} + T_A$$

$$= 30\text{ mW} \cdot 339^\circ\text{C/W} + 230\text{ mW} \cdot 140^\circ\text{C/W} + 100^\circ\text{C}$$

$$= 142^\circ\text{C}$$

$$T_{JD} = P_E \cdot 140^\circ\text{C/W} + P_D \cdot 194^\circ\text{C/W} + T_A$$

$$= 30\text{ mW} \cdot 140^\circ\text{C/W} + 230\text{ mW} \cdot 194^\circ\text{C/W} + 100^\circ\text{C}$$

$$= 149^\circ\text{C}$$

$T_{JE}$  and  $T_{JD}$  should be limited to  $150^\circ\text{C}$  based on the board layout and part placement ( $\theta_{CA}$ ) specific to the application.

Figure 30. This capacitive coupling causes perturbations in the LED current during common mode transients and becomes the major source of CMR failures for a shielded optocoupler. The main design objective of a high CMR LED drive circuit becomes keeping the LED in the proper state (on or off) during common mode transients. For example, the recommended application circuit (Figure 25), can achieve  $25\text{ kV}/\mu\text{s}$  CMR while minimizing component complexity. Techniques to keep the LED in the proper state are discussed in the next two sections.

Figure 30. Optocoupler input to output capacitance model for shielded optocouplers.

**CMR with the LED On (CMRH).**

A high CMR LED drive circuit must keep the LED on during common mode transients. This is achieved by overdriving the LED current beyond the input threshold so that it is not pulled below the threshold during a transient. A minimum LED current of 10 mA provides adequate margin over the maximum IFLH of 5 mA to achieve 25 kV/μs CMR. CMR with the LED Off (CMRL). A high CMR LED drive circuit must keep the LED off ( $V_F \leq V_{F(OFF)}$ ) during common mode transients. For example, during a  $-dV_{CM}/dt$  transient in Figure 31, the current flowing through  $C_{LEDP}$  also flows through the  $R_{SAT}$  and  $V_{SAT}$  of the logic gate. As

long as the low state voltage developed across the logic gate is less than  $V_{F(OFF)}$ , the LED will remain off and no common mode failure will occur. The open collector drive circuit, shown in Figure 32, cannot keep the LED off during a  $+dV_{CM}/dt$  transient, since all the current flowing through  $C_{LEDN}$  must be supplied by the LED, and it is not recommended for applications requiring ultra high CMRL performance. Figure 33 is an alternative drive circuit which, like the recommended application circuit (Figure 25), does achieve ultra high CMR performance by shunting the LED in the off state.

Figure 33. Recommended LED drive circuit for ultra-high CMR.

The ACPL-312T contains an under voltage lockout (UVLO) feature that is designed to protect the IGBT under fault conditions which cause the ACPL-312T supply voltage (equivalent to the fully-charged IGBT gate voltage) to drop below a level necessary to keep the IGBT in a low resistance state. When the ACPL-312T output is in the high state and the supply voltage drops below the ACPL-312T  $V_{UVLO-}$  threshold ( $9.5 < V_{UVLO-} < 12.0$ ) the optocoupler output will go into the low state with a typical delay, UVLO Turn Off Delay, of  $0.6 \mu s$ . When the ACPL-312T output is in the low state and the supply voltage rises above the ACPL-312T  $V_{UVLO+}$  threshold ( $11.0 < V_{UVLO+} < 13.5$ ) the optocoupler output will go into the high state (assumes LED is "ON") with a typical delay, UVLO Turn On Delay of  $0.8 \mu s$ .

## Dead Time and Propagation Delay Specifications

The ACPL-312T includes a Propagation Delay Difference (PDD) specification intended to help designers minimize "dead time" in their power inverter designs. Dead time is the time period during which both the high and low side power transistors (Q1 and Q2 in Figure 25) are off. Any overlap in Q1 and Q2 conduction will result in large currents flowing through the power devices between the high and low voltage motor rails.

To minimize dead time in a given design, the turn on of LED2 should be delayed (relative to the turn off of LED1) so that under worst-case conditions, transistor Q1 has just turned off when transistor Q2 turns on, as shown in Figure 35. The amount of delay necessary to achieve this condition is equal to the maximum value of the propagation delay difference specification,  $PDD_{MAX}$ , which is specified to be  $350 ns$  over the operating temperature range of  $-40^{\circ}C$  to  $125^{\circ}C$ . Delaying the LED signal by the maximum propagation delay difference ensures that the minimum dead time is zero, but it does not tell a designer what the maximum dead time will be. The maximum dead time is equivalent to the difference between the maximum and minimum propagation delay difference specifications as shown in Figure 36. The maximum dead time for the ACPL-312T is  $700 ns$  ( $= 350 ns - (-350 ns)$ ) over an operating temperature range of  $-40^{\circ}C$  to  $125^{\circ}C$ .

Note that the propagation delays used to calculate PDD and dead time are taken at equal temperatures and test conditions since the optocouplers under consideration are typically mounted in close proximity to each other and are switching identical IGBTs.
