## AEDR-9820

# Three Channels Reflective Incremental Encoders Analog and Digital Output (225 LPI) 

## Description

The Broadcom ${ }^{\circledR}$ AEDR-9820 is a three-channel reflective optical encoder. It can be configured to analog or digital outputs employing reflective technology for motion control purposes. The selectable options available are two channels differential analog with a third channel differential digital or analog index output or three-channel digital differential A, B, and I output.

The AEDR-9820 in analog encoder modes, with two-channel differential analog outputs ( $\mathrm{Sin}, / \mathrm{Sin}, \mathrm{Cos}$, /Cos), can be interfaced directly with external interpolators available.

The AEDR-9820 in digital encoder mode offers two-channel (AB) quadrature digital outputs and a third channel digital index output. Being TTL compatible, the outputs of the AEDR-9820 encoder can be interfaced with most of the signal processing circuitries. Therefore, the encoder provides easy integration and flexible design into existing systems.

The AEDR-9820 encoder is designed to operate over $-40^{\circ} \mathrm{C}$ to $115^{\circ} \mathrm{C}$ temperature range and is suitable for commercial, industrial, and automotive end applications.

The encoder houses an infrared LED light source and a photodetecting circuitry in a single package. The small size of $4.00 \mathrm{~mm}(\mathrm{~L}) \times 4.00 \mathrm{~mm}(\mathrm{~W}) \times 1.05 \mathrm{~mm}(\mathrm{H})$ allows it to be used in a wide range of miniature commercial applications, where size and space are primary concerns.

## Features

- Analog Output option - Two-channel differential analog output and differential digital or analog index output.
- Digital Output option - Three-channel differential or TTL compatible; two-channel quadrature (AB) digital outputs for direction sensing and a third channel, index digital output.
- Built in interpolator for $1 \mathrm{x}, 2 \mathrm{x}, 4 \mathrm{x}, 8 \mathrm{x}$, and 16 x interpolation.
- Surface mount leadless package $-4.0 \mathrm{~mm}(\mathrm{~L}) \times$ $4.0 \mathrm{~mm}(\mathrm{~W}) \times 1.05 \mathrm{~mm}(\mathrm{H})$.
- Operating voltage of 3.3 V and 5.0 V supply.
- Built-in LED current regulation.
- Wide operating temperature range from $-40^{\circ} \mathrm{C}$ to $115^{\circ} \mathrm{C}$.
- High encoding resolution: 225 LPI (lines/in.) or 8.86 LPmm (lines/mm).

## Applications

- Closed-loop stepper motors
- Small motors, actuators
- Industrial printers
- Robotics
- Card readers
- Pan-tilt-zoom camera
- Portable medical equipment
- Optometric equipment
- Linear stages

## Test Parameter Definitions

| Analog Peak-to-Peak | Vpp | The peak-to-peak signal magnitude in V of the analog signal. |
| :--- | :--- | :--- |
| Analog Offset | $\mathrm{V}_{\mathrm{OFFSET}}$ | The offset in mV from the mid-point of the analog peak-to-peak signal to the zero <br> voltage point. |
| Analog Peak/Valley Voltage | $\mathrm{V}_{\mathrm{PA}}, \mathrm{V}_{\mathrm{PB}}$ <br> $\mathrm{V}_{\mathrm{MA}}$, | The value in V of the peak/valley of the analog signal (that is, one-sided reading). |
| Analog Peak to Peak Voltage | $\mathrm{V}_{\mathrm{PPA}}, \mathrm{V}_{\mathrm{PPB}}$ | The absolute difference between $\mathrm{V}_{\mathrm{P}}$ and $\mathrm{V}_{\mathrm{M}}$ of channel A or B. |

## Digital Output Option

## Digital Parameter Definitions

| Count | N | The number of bar and window pairs or counts per revolution (CPR) of the code <br> wheel. |
| :--- | :--- | :--- |
| Cycle | C | 360 electrical degrees $\left({ }^{\circ} \mathrm{e}\right), 1$ bar and window pair. <br> One shaft rotation: 360 mechanical degrees, N cycles. |
| Cycle Error | $\Delta \mathrm{P}$ | An indication of cycle uniformity. The difference between an observed shaft angle <br> that gives rise to one electrical cycle, and the nominal angular increment of $1 / \mathrm{N}$ of <br> a revolution. |
| Pulse Width (Duty) Error | S | The deviation, in electrical degrees, of the pulse width from its ideal value of <br> $180^{\circ} \mathrm{e}$. |
| State | The number of electrical degrees between a transition in the output of channel A <br> and the neighboring transition in the output of channel B. There are four states per <br> cycle, each nominally $90^{\circ} \mathrm{e}$. |  |
| Phase | The number of electrical degrees between the center of the high state of <br> channel A and the center of the high state of channel B. This value is nominally <br> $90^{\circ} e$ for quadrature output. |  |
| Optical Radius | $\mathrm{P}_{0}$ | The distance from the code wheel's center of rotation to the optical center (O.C.) <br> of the encoder module. |
| Index Pulse Width | The number of electrical degrees that an index is high in one cycle. |  |

## Absolute Maximum Ratings

| Description and Symbol | Units |
| :--- | :--- |
| Storage Temperature, $\mathrm{T}_{\mathrm{S}}$ | $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ |
| Operating Temperature, $\mathrm{T}_{\mathrm{A}}$ | $-40^{\circ} \mathrm{C}$ to $115^{\circ} \mathrm{C}$ |
| Supply Voltage, $\mathrm{V}_{\mathrm{CC}}$ | 7 V |

## NOTE:

1. Proper operation of the encoder cannot be guaranteed if the maximum ratings are exceeded.
2. Remove the kapton tape only after the SMT reflow process and just before final assembly. Take precautions to keep the encoder ASIC clean at all times.
3. Some particles may be present on the surface of the encoder ASIC surface. The presence of these particles do not degrade the performance of the encoder.

CAUTION! Take anti-static discharge precautions when handling the encoder to avoid damage, degradation, or both, induced by ESD.

## Recommended Operating Conditions

Figure 5: Open Selection

The digital interpolation factor above may be used with the following equations to cater to various rotational speed (RPM) and count per revolution (CPR).

RPM $=($ Count Frequency $\times 60) /$ CPR.
The CPR (at 1X interpolation) is based on the following equation that is dependent on radius of operation (ROP).
$C P R=\operatorname{LPI} \times 2 \pi \times R O P(i n$.$) or C P R=L P m m \times 2 \pi \times R O P(m m)$.
NOTE: LPmm (lines per mm) $=$ LPI / 25.4.

## Recommended Setup for the Power Supply Pins and General Routing

Both VDDA, VDD, and the respective grounds (VSSA and VSSD) are to be connected as follows. Follow these recommended schematic design rules:

- Use a pair of $22-\mu \mathrm{F}$ and $0.1-\mu \mathrm{F}$ capacitors as bypass on VDD and VDDA. Place them in parallel as close as possible to the encoder ASIC package, in between the power and ground pins.
- Avoid routing the INDEX trace in parallel and close to the analog signals to reduce the INDEX signal switching noise from coupling into the analog signal.
- Design separate VDD and VDDA traces.
- Minimize trace or cable length wherever possible.
- For single-ended applications, do not ground the Output- from the encoder. Allow the output to float.

Figure 6: Connection Diagram

NOTE:

1. Pin 25 is the center pad of the package and is designated as AGND.
2. See the table in Select Options - Encoder Built-in Interpolation for SEL1X, SEL2X, and IND SEL configurations.

## Code Wheel Design Guideline

The Incremental/Index window track is a reflective surface and the Incremental bar track is opaque.
The window width is denoted by $\mathrm{W}_{\text {window }}{ }^{\circ}$ and the bar width is denoted by $\mathrm{W}_{\text {bar }}{ }^{\circ}$.
All windows and bars has the same width value, $\mathrm{d}^{\circ}$.
There is an offset between Incremental window track and Index window track, denoted by e ${ }^{\circ}$.
There should be minimum one Index window track, while the number of Incremental window/bar tracks depends on the CPR. The $\mathrm{W}_{\text {window }} / \mathrm{W}_{\text {bar }}$ ratio is recommended to be within a range of 0.9 to 1.1.
Reflectance of window and bar surface is $60 \%$ and $5 \%$, respectively.

| Determine $\mathrm{R}_{\text {I_INC }}$ and $\mathrm{R}_{\mathrm{O} \text { _INDEX }}$; | $4.600-(0.551 / 2)$ | $=4.325 \mathrm{~mm}$ |
| Determine $\mathrm{R}_{\text {I_INDEX }}$; | 4.049-0.350 | $=3.699 \mathrm{~mm}$ |
| Determine $\mathrm{W}_{\text {window }}$ and $\mathrm{W}_{\text {bar }}$; | $(360 / 256) / 2$ | $=0.703^{\circ}$ |
| Determine offset between Window ${ }_{\text {INC }}$ and Window ${ }_{\text {INDEX }}$; | $(3 / 4) \times 0.703$ | $=0.527^{\circ}$ |

## Code Strip Design Guideline

The Incremental/Index window track is reflective surface and the Incremental bar track is opaque.
The window width is denoted by $\mathrm{W}_{\text {window }}$ and the bar width is denoted by $\mathrm{W}_{\text {bar }}$.
All windows and bars has the same width value, $d$.
There is an offset between Incremental window track and Index window track, denoted by e.

## Multiple Index Pulse Code Wheel or Strip Design Guideline

For a pseudo absolute encoder application, the multiple Index pulse can be designed into the code wheel or the code strip. The minimum index bar width is $3 x$ the incremental pitch.

Figure 9 shows the recommended multiple Index pulse design guideline.

## Encoder Placement Orientation, Position, and Direction of Movement

The AEDR-9820 is designed with both the emitter and detector dice placed in parallel to the code wheel window/bar orientation. The encoder package mounted on the top, facing down onto the code wheel. When properly aligned, the detector side will be closer to the center of the code wheel than the emitter.

The optical center of the encoder package must be aligned tangential to the code wheel's ROP. The optimal gap setting recommended is 1.00 mm , with the range of 0.50 mm to 1.50 mm .

Channel A leads Channel B when the code wheel rotates counter-clockwise and vice versa.

## Moisture Sensitivity Level

The AEDR-9820 package is specified to moisture sensitive level 3 (MSL 3). Take precautions when handling this moisture-sensitive product to ensure the reliability of the product.

## Storage before use

- An unopen moisture barrier bag (MBB) can be stored at $<40^{\circ} \mathrm{C} / 90 \% \mathrm{RH}$ for 12 months.
- Open the MBB just prior to assembly.

## Control after opening the MBB

The encoder that will be subjected to reflow solder must be mounted within 168 hours of factory condition $<30^{\circ} \mathrm{C} / 60 \% \mathrm{RH}$.

## Control for unfinished reel

Store a sealed MBB with desiccant or desiccators at <5\% RH condition.

## Baking is required if the following conditions exist:

- The humidity indicator card (HIC) is $>10 \%$ when read at $23^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$.
- The encoder floor life exceeded 168 hours.

The recommended baking condition: $60^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$ for 20 hours (tape and reel) or $125^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$ for 5 hours (loose units).
Figure 14: Recommended Lead Free Solder Reflow Soldering Temperature Profile

CAUTION! Exercise care when handling the encoder ASIC because it is a sensitive optical device. Remove the protective kapton tape only after the reflow process and just before final assembly.
