# ASSR-1218, ASSR-1219, and ASSR-1228 <br> Form A, Solid State Relay <br> (Photo MOSFET) (60V/0.2A/10』) 

## Description

The Broadcom ${ }^{\circledR}$ ASSR-12XX Series consists of an AIGaAs infrared light-emitting diode (LED) input stage that is optically coupled to a high-voltage output detector circuit. The detector consists of a high-speed photovoltaic diode array and driver circuitry to switch on/off two discrete high-voltage MOSFETs. The relay turns on (contact closes) with a minimum input current of 3 mA through the input LED. The relay turns off (contact opens) with an input voltage of 0.8 V or less.

The single channel configurations, ASSR-1218 and ASSR-1219, are equivalent to 1 Form A Electromechanical Relays (EMR), and the dual-channel configuration, ASSR-1228, is equivalent to 2 Form A EMR. They are available in 4-pin SO, 6-pin DIP, 8-pin DIP, and gull wing surface mount for DIP packages.

ASSR-1219 enables AC/DC and DC-only output connections. For DC-only connection, the output current, $\mathrm{I}_{\mathrm{O}}$, increases to 0.4A and the On-Resistance, $\mathrm{R}_{(\mathrm{ON})}$ reduces to 2.5ת.

## Features

- Compact solid-state bidirectional signal switch
- Single and dual-channel normally-off Single-Pole-Single-Throw (SPST) relay
- 60 V output withstand voltage
- 0.2 A or 0.4 A current rating
- See schematics for ASSR-1219 Connection A and Connection B
- Low input current: CMOS compatibility
- Low On-Resistance
- $0.25 \Omega$ typical for DC-only
- $1 \Omega$ typical for AC/DC
- High input-to-output insulation voltage (safety and regulatory approved)
- $3750 \mathrm{~V}_{\text {rms }}$ for 1 minute per UL1577
- CSA Component Acceptance

## Applications

- Telecommunications switching
- Data communications
- Industrial controls
- Medical systems
- Security systems
- EMR/Reed Relay replacement

CAUTION! It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and degradation which may be induced by ESD.

The components featured in this data sheet are not to be used in military or aerospace applications or environments. The components are not AEC-Q100 qualified and are not recommended for automotive applications.

To order, choose a part number from the Part Number column and combine it with the desired option from the Option column to form an order entry.

Example: Select ASSR-1219-501E to order the product consisting of a 300-mil DIP-6 gull wing surface mount package in tape and reel packaging that is RoHS compliant.
Example: Select ASSR-1228-002E to order the product consisting of a 300-mil DIP-8 package in tube packaging that is RoHS compliant.

Option data sheets are available. Contact your Broadcom sales representative or authorized distributor for information.

## Application Information

## On-Resistance and Derating Curves

The Output On-Resistance, $\mathrm{R}_{(\mathrm{ON})}$, specified in this data sheet is the resistance measured across the output contact when a pulse current signal $\left(l_{0}=200 \mathrm{~mA}\right)$ is applied to the output pins. The use of a pulsed signal ( $\leq 30 \mathrm{~ms}$ ) implies that each junction temperature is equal to the ambient and case temperatures. The steady-state resistance, $\mathrm{R}_{\mathrm{SS}}$, on the other hand, is the value of resistance measured across the output contact when a DC current signal is applied to the output pins for a duration sufficient to reach thermal equilibrium. $R_{S S}$ includes the effects of the temperature rise in the device.

Figure 1: Maximum Output Current Rating vs. Ambient Temperature (ASSR-1218-003E)

Figure 3: Maximum Output Current Rating vs. Ambient Temperature (ASSR-1219-001E DC Connection)

Figure 1, Figure 2, Figure 3, and Figure 4 specify the maximum average output current allowable for a given ambient temperature. The maximum allowable output current and power dissipation are related by the following expression, from which $R_{S S}$ is calculated:

$$
\mathrm{R}_{\mathrm{SS}}=\mathrm{P}_{\mathrm{O}(\text { max })} \div\left(\mathrm{I}_{(\text {max })}\right)^{2}
$$

Staying within the safe area assures that the steady state MOSFET junction temperature remains less than $125^{\circ} \mathrm{C}$.
