# Managed Switch with 24 FE Ports + 4-GbE Interface

## GENERAL DESCRIPTION

The BCM53242M is a ninth-generation RoboSwitch™ design based on the field-proven BCM5324 device. This integrated 0.13μ-CMOS device combines all the functions of a high-speed switch system including packet buffers, PHY transceivers, Media Access Controllers (MACs), address management, and a nonblocking switch fabric. It is designed to be fully compliant with the IEEE 802.3 and IEEE 802.3x specifications, including the MAC control PAUSE frame, auto-negotiation and with all industry-standard Ethernet and Fast Ethernet devices.

The BCM53242M contains 24 full-duplex 10Base-T/ 100Base-TX Fast Ethernet transceivers with Advanced Cable Diagnostics support. Each performs all physical layer interface functions for 10Base-T Ethernet on Category 3, 4, or 5 Unshielded Twisted Pair (UTP) cable and 100Base-TX Fast Ethernet on Category 5 UTP cable. The BCM53242M has two GMII/RGMII/TBI interfaces that provide flexible 10/100/1000Base-TX/FX connectivity. An additional MAC is included for CPU connection via RvMII/MII interface.

The BCM53242M has a rich feature set suitable for streaming VoIP, video, and data traffic for multimedia applications. The BCM53242M supports up to four QoS queues per port. Traffic QoS can be assigned based on Port-ID, MAC Address, 802.1p or DiffServ. Together with 4K entries, 802.1Q VLAN, 802.1x EAPOL protocol filtering, MAC-based link aggregation with dynamic failover, per-port bandwidth/rate control, MAC address locking, and IGMP snooping at Layer 3 allow system vendors to build advanced L2+ switch systems for the Multitenant/Multidweller Unit (MTU/MDU) markets.The BCM53242M provides 70+ on-chip MIB counters to collect receive and transmit statistics for each port.

## FEATURES

- Ninth-generation L2+ Fast Ethernet switch with two GMII/RGMII/TBI interfaces.
  - 24-port 10/100 transceivers for TX/EFX.
  - Advanced Cable Diagnostic support.
  - 25 10/100 MACs.
  - Two Gigabit MACs.
  - 3-Mbit (384 KB) packet buffer and control memory.
  - Management Port with RvMII/MII interface.
- Nonblocking switch fabric for 24 FE + 2 GbE ports.
- Jumbo frame support up to 2048 bytes.
- Flexible TCAM-based Compact Field Processor for packet classification and filtering.
- Packet Remarking, VID Replacement.
  - 802.1p PCP, DSCP remarking.
- Optimized for managed switch design.
- 802.1p, Port, MAC, Protocol, Customer_VID, and DiffServ (IPv4/IPv6) based QoS packet classification with four priority queues.
- Port-based VLAN.
- 802.1Q-based VLAN with 4K entries.
- MAC-based VLAN with 512 entries.
- Protocol-based VLAN with 16 entries.
- VLAN Translation.
- Double tagging.
  - UNI/NNI configuration per port for edge access application.
  - QinQ packet transmission through NNI port.
  - Programmable global SP_TPID.
  - Programmable SP_VID through flexible mapping.
- Link Aggregation support with automatic link fail-over.
- Programmable per-port Bandwidth/Rate control.
- Protected port security feature.
- Port mirroring (Ingress/Egress), IGMP Layer 3. snooping and MLD snooping.
- Spanning Tree support (802.1d/1s/1w).
- Supports 802.1x EAPOL higher layer protocol.
- Programmable Broadcast, Multicast, and Unknown Unicast storm control.8K MAC addresses with automatic learning and aging.
- MDC/MDIO and SPI interfaces.
- 4K-entry Multicast Address table.
- Hardware supports SNMP, RMON.
- Internal oscillator simplifies design and reduces cost.
- JTAG.
- 2.5V and 1.2V, typical power consumption: ~ 4.3W.
- 400-pin PBGA package.

53242M-DS302-R

# About This Document

## Purpose and Audience

This document provides details of the functional, operational, and electrical characteristics of the Broadcom®
BCM53242M. It is intended for hardware design, application, and OEM engineers.

## Acronyms and Abbreviations

In most cases, acronyms and abbreviations are defined on first use.

For a comprehensive list of acronyms and other terms used in Broadcom documents, go to:
http://www.broadcom.com/press/glossary.php.

## Document Conventions

The following conventions may be used in this document:

| Convention | Description |
| --- | --- |
| **Bold** | User input and actions: for example, type **exit**, click **OK,** press **Alt+C** |
| Monospace | Code: `#include <iostream>`<br>HTML: `<td rowspan = 3>`<br>Command line commands and parameters: `wl [-l] <command>` |
| < > | Placeholders for *required* elements: enter your <username> or `wl <command>` |
| [ ] | Indicates *optional* command-line parameters: `wl [-l]`<br>Indicates bit and byte ranges (inclusive): [0:3] or [7:0] |

# Technical Support

Broadcom provides customer access to a wide range of information, including technical documentation,
schematic diagrams, product bill of materials, PCB layout information, and software updates through its
customer support portal (https://support.broadcom.com). For a CSP account, contact your Sales or Engineering
support representative.

In addition, Broadcom provides other product support through its Downloads & Support site
(http://www.broadcom.com/support/).

# Section 1: Introduction

## Overview

The Broadcom® BCM53242M is a single-chip, 24-port 10/100Base-TX and 2-port 10/100/1000Base-T GMII switch device. This device integrates the following functions:

- 24 fully integrated 10/100Base-TX/EFX compatible PHY transceivers

- Two-port 10/100/1000 GMII/RGMII/TBI interface

- 25 integrated 10/100 MACs

- Management port via RvMII/MII interface

- A Serial Peripheral Interface (SPI) and MDC/MDIO Interface allowing the device to be custom-configured

- Flexible TCAM-based Compact Field Processor

- High-performance integrated packet buffer memory

- An address resolution engine

- Nonblocking switch controller

- Set of Management Information Base (MIB) statistics registers

The Serial Peripheral Interface allows the device to be custom-configured and bridge management to be implemented.

The integrated 10/100Base-TX transceivers perform all the physical layer interface functions for 100Base-TX full-duplex or half-duplex Ethernet on CAT-5 twisted pair cable and 10Base-T full-duplex or half-duplex Ethernet on CAT-3, -4, or -5 cable. Each of the integrated transceiver ports of the BCM53242M connects directly to the network media through isolation transformers. The integrated transceiver is fully compliant with the IEEE 802.3 and 802.3u standards.

Each MAC supports full and half-duplex for 10 Mbps and 100 Mbps and the Gigabit MACs additional support full-duplex operation at 1 Gbps. Flow control is provided in half-duplex mode with backpressure. In full-duplex mode, 802.3x frame-based flow control is provided. The MAC is 802.3 compliant and supports a maximum frame size of 2048 bytes.

The BCM53242M supports advanced ContentAware™ processing via a Compact Fast Field Processor (CFP). Up to three intelligent ContentAware processes are performed in parallel for every packet. This flexible engine uses a TCAM-based architecture with wildcard capabilities; specific areas of the incoming packet to be masked and matched can be defined. Furthermore, multiple actions can be performed per packet as a result of a match. Action examples include dropping, changing of the port forwarding map, changing priority of frame, etc. These advanced ContentAware processes are well suited for both Access Control List and Security protection, for example, DOS prevention.

An integrated address management engine provides address learning and recognition functions at maximum frame rates. The address table provides capacity for up to 8K unicast and multicast addresses. Addresses are added to the table after receiving an error-free packet. Broadcast and multicast frames are forwarded to all ports within the VLAN domain except the port where it was received.

The MIB statistics registers collect receive and transmit statistics for each port, and provide direct hardware support for the Etherlike MIB, Bridge MIB, MIB II (Interfaces), and the first four groups of the RMON MIB. All nine groups of RMON can be supported by using additional capabilities, such as port mirroring/snooping, together with an external microcontroller to process some MIB attributes. The MIB registers can be accessed through the Serial Peripheral Interface Port by an external microcontroller.

# Audience

This document is for designers interested in integrating the BCM53242M switch into their hardware designs, and others who need specific data about the physical characteristics and operation of the BCM53242M switch.

# Data Sheet Information

The following notational conventions are used in this document:

- Signal names are shown in UPPERCASE letters. For example: DATA
- A bar over a signal name indicates that it is active low. For example: $\overline{\text{CE}}$.
- In register and signal descriptions, [n:m] indicates a range from bit n to bit m. For example: [7:0] indicates bits 7 through 0, inclusive.
- The use of R or RESERVED indicates that a bit or field is reserved by Broadcom for future use. Typically R is used for individual bits and RESERVED is used for fields.
- Numerical modifiers such as K or M follow traditional usage. For example, 1 KB means 1,024 bytes, 100 Mbps (referring to Fast Ethernet speed) means 100,000,000 bits per second, and 133 MHz means 133,000,000 Hertz.

Where it seems helpful, cross-reference links have been incorporated in the data sheet. The cross-reference is denoted in blue text. When using a PDF version of the data sheet, jump to other sections of the data sheet by clicking on the blue text using the PDF hand tool.

*Example:* Clicking on the text: "Features and Operation" on page 36 jumps to the next section. To return, press the left-arrow key while holding down the alt key. It returns to the previous view. Likewise, pressing the right-arrow key while holding down the alt key jumps to next view.

As always, every effort is made to improve the data sheet and other documentation. To submit suggestions, send e-mail to RoboDocs@broadcom.com. For technical questions, please contact your local sales representative.

# Section 2: Features and Operation

## Overview

The BCM53242M includes the following features:

- "Quality of Service" on page 37
- "Port-Based VLANs" on page 42
- "802.1Q VLANs" on page 43
- "MAC-based VLANs" on page 43
- "Protocol-based VLANs" on page 43
- "Customer-Tag-Based VLANs" on page 43
- "Double Tagging" on page 45
- "Link Aggregation" on page 51
- "Rate Control" on page 52
- "Protected Ports" on page 54
- "Port Mirroring" on page 55
- "IGMP and MLD Snooping" on page 56
- "Jumbo Frame Support" on page 56
- "802.1x Port-Based Security" on page 56
- "Dynamic Secure MAC Mode" on page 57
- "Address Management" on page 57
- "Bridge Management" on page 63
- "Compact Field Processor" on page 65
- "Packet Remarking" on page 73
- "VID Replacement" on page 74

Each topic is discussed in more detail in the following sections.

# Quality of Service

The Quality of Service (QoS) feature provides up to four internal queues per port to support four different traffic priorities. These priorities can be programmed in such a way that higher-priority traffic experiences less delay in the switch under congested conditions than the latency of lower-priority traffic. This can be important in minimizing latency for delay-sensitive traffic. The BCM53242M can assign the packet to one of the four egress transmit queues according to information in:

- "Port-Based QoS" on page 38 (ingress port ID)
- "802.1p QoS" on page 38
- "Protocol-Based QoS" on page 39
- "MAC SA-Based QoS" on page 39
- "DiffServ Based QoS" on page 40
- "Reason Code Based QoS" on page 41

> **Note:** Only 1Q or 4Q mode is supported

> **Note:** As a part of the QoS discussion, it is important to understand the BCM53242M Egress port Queue structure.

## Egress Transmit Queues

Each egress port can support up to four transmit queues. Each egress transmit queue contains a list specifying the packet transmission order. Every incoming frame is forwarded to one of the four egress transmit queues of the assigned egress port, based on its priority. The egress port transmits packets from each of the four transmit queues according to a configurable scheduling algorithm, which can be a combination of Strict Priority (SP) and/or Weighted Round Robin (WRR). The following scheduling algorithm combinations are available in the BCM53242M:

- Four Strict Priority queues
- Four Weighted Round Robin queues
- One Strict Priority and three Weighted Round Robin queues
- Two Strict Priority and two Weighted Round Robin queues

When a queue is designated as the strict-priority queue, all other lower-priority queues are prevented from transmitting packets until the strict-priority queue is empty. Furthermore, the traffic at each egress port is gated by a Shaper, so that the aggregated output from the queues can be scheduled by a programmable Egress Rate Control, with a granularity of 64 Kbps. Egress Rate Control details are further described within this data sheet.

Figure 2 shows the Shaping-Scheduling structure of each Egress port.
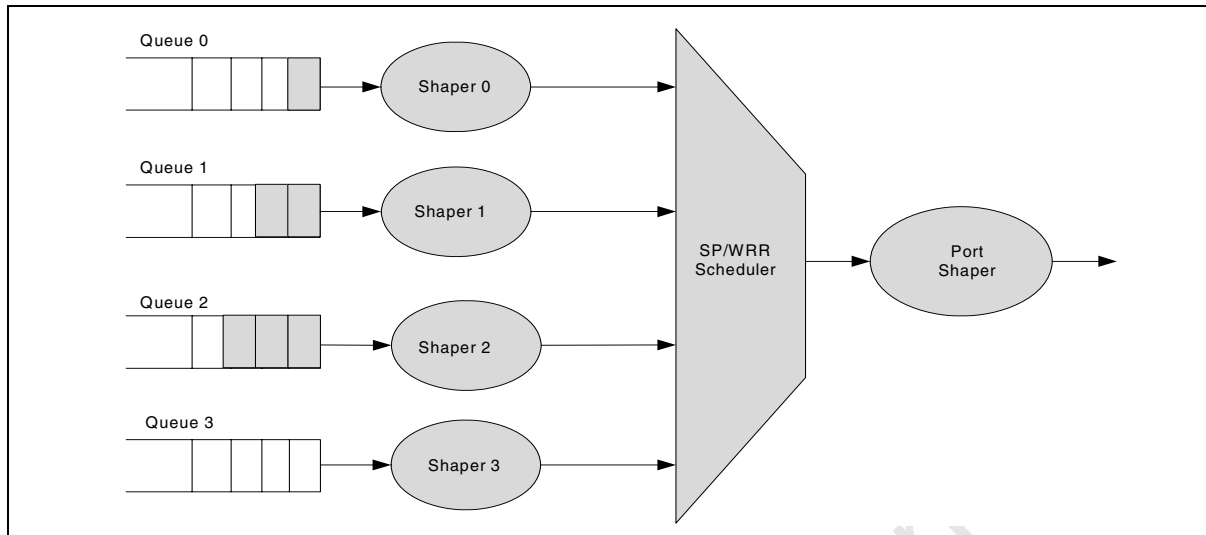

**Figure 2:  Shaping-Scheduling Structure of Each Egress port**

## Port-Based QoS

When using the port-based priority mechanism, the port-based priority of each ingress port determines the egress queue assigned to frames arriving via the associated ingress port. The frames will be assigned to the priority queue based on the upper 3-bit per port COS value programmed in the 802.1Q Default Port Tag.

Follow the sequence below to enable Port-Based QoS:

1). Enable bit[63], as shown in Table 270: "QoS Control Register (Pages: 30h, Address 10h–17h)," on page 289.

2). Enable bits[59:58] of QoS Control register.

3). Program the upper 3-bit of per-port COS value as shown in Table 290: "802.1Q Default Port Tag Register (Page: 34h, Address 40h–75h)," on page 308.

4). To select the desired queue, program the register shown in Table 274: "Priority Threshold Register (Page 30h: Address 30h–31h)," on page 292.

## 802.1p QoS

When using 802.1p priority mechanism, the packet is examined for the presence of a valid 802.1p priority tag. If the tag is present, the packet is assigned to a programmable egress queue based on the value of the tagged priority. The tagged priority can be designated to any of the available queues.

Follow the sequence below to enable 802.1p QoS:

1). Enable bit[63], as shown in Table 270: "QoS Control Register (Pages: 30h, Address 10h–17h)," on page 289.

2). Enable bits[59:58] of QoS Control register.

3). To select the desired queue, program the register shown in Table 274: "Priority Threshold Register (Page 30h: Address 30h–31h)," on page 292.

# Protocol-Based QoS

When using Protocol Based QoS, the EtherType field carried with the incoming packet is used to map the packet to one of the available output queues at the destination port. Protocol-based QoS shares the same control bit and 16-entry Protocol to VLAN mapping table with Protocol-based VLAN. The upper 3-bit in the Protocol to VLAN mapping table is used to program the Protocol-Based priority select field. This mapping can be enabled/disabled per port, but the mapping table is configured globally.

Follow the sequence below to enable Protocol-Based QoS:

1. Enable bit[63], of the QoS Control register (see Table 270: "QoS Control Register (Pages: 30h, Address 10h–17h)," on page 289).

2. Enable bits[59:58] of the QoS Control register.

3. Program the 3-bits of the per-port COS value in the Protocol to VLAN mapping table. (see TBL_DATA_0[30:28] of Table 134: "Multitable Data 0 Register (Page 05h: Address 38h–3Fh)," on page 221

4. To select the desired queue, program the Priority Threshold Register (see Table 274: "Priority Threshold Register (Page 30h: Address 30h–31h)," on page 292).

5. Program the Protocol to VLAN Control register (see Table 296: "Protocol To VLAN Control Register (Pages: 34h, Address B0h–B7h)," on page 314) to enable/disable per-port Protocol-Based QoS.

# MAC SA-Based QoS

When using MAC SA-Based QoS, the source address field carried with the incoming packet is used to map the packet to one of the available output queues at the destination port. MAC-Based QoS shares the same control bit and 512-entry MAC to VLAN mapping table with MAC-Based VLAN. The upper 3-bits in the MAC to VLAN mapping table is used to program the MAC-Based priority select field. This mapping can be enabled/disabled per port, but the mapping table is configured globally.

Follow the sequence below to enable MAC SA-Based QoS:

1. Enable bit[63], of the QoS Control register (see Table 270: "QoS Control Register (Pages: 30h, Address 10h–17h)," on page 289).

2. Enable bits[59:58] of the QoS Control register.

3. Program the 3-bits of the per-port COS value in the MAC to VLAN mapping table. (see TBL_DATA_0[62:60] of Table 134: "Multitable Data 0 Register (Page 05h: Address 38h–3Fh)," on page 221

4. To select the desired queue, program the Priority Threshold Register (see Table 274: "Priority Threshold Register (Page 30h: Address 30h–31h)," on page 292).

5. Program MAC to VLAN Control register. See Table 295: "MAC To VLAN Control Register (Pages: 34h, Address A8h–AFh)," on page 313) to enable/disable per port MAC-Based QoS.

# DiffServ Based QoS

When using the DiffServ priority mechanism, the packet is classified based on the DSCP field in the IP header. If the tag is present, the packet is assigned to a programmable egress queue based on the value of the tagged priority. The tagged priority can be designated to any of the available queues.

Follow the sequence below to enable DiffServ-Based QoS:

1. Enable bit[63], of the QoS Control register (see Table 270: "QoS Control Register (Pages: 30h, Address 10h–17h)," on page 289).

2. Enable bits[59:58] of the QoS Control register.

3. To select the desired queue, program the Table 275: "DiffServ DSCP Priority Register 1 (Page 30h: Address 40h–47h)," on page 293) and Table 276: "DiffServ DSCP Priority Register 2 (Page 30h: Address 48h–4Fh)," on page 293.

# QoS Resolution Tree

The resolution tree shown in the next figure determines which priority based QoS is used. There are two levels of determining which queue of egress port the packet is going to be assigned. The first level of how incoming packet QoS is determined is shown in Figure 3, the QoS value from the first level QoS resolution is then muxed with the QoS value from the Compact Field Processor to be the final QoS value for the egress queue. The second level QoS resolution tree is shown in Figure 4 on page 42.

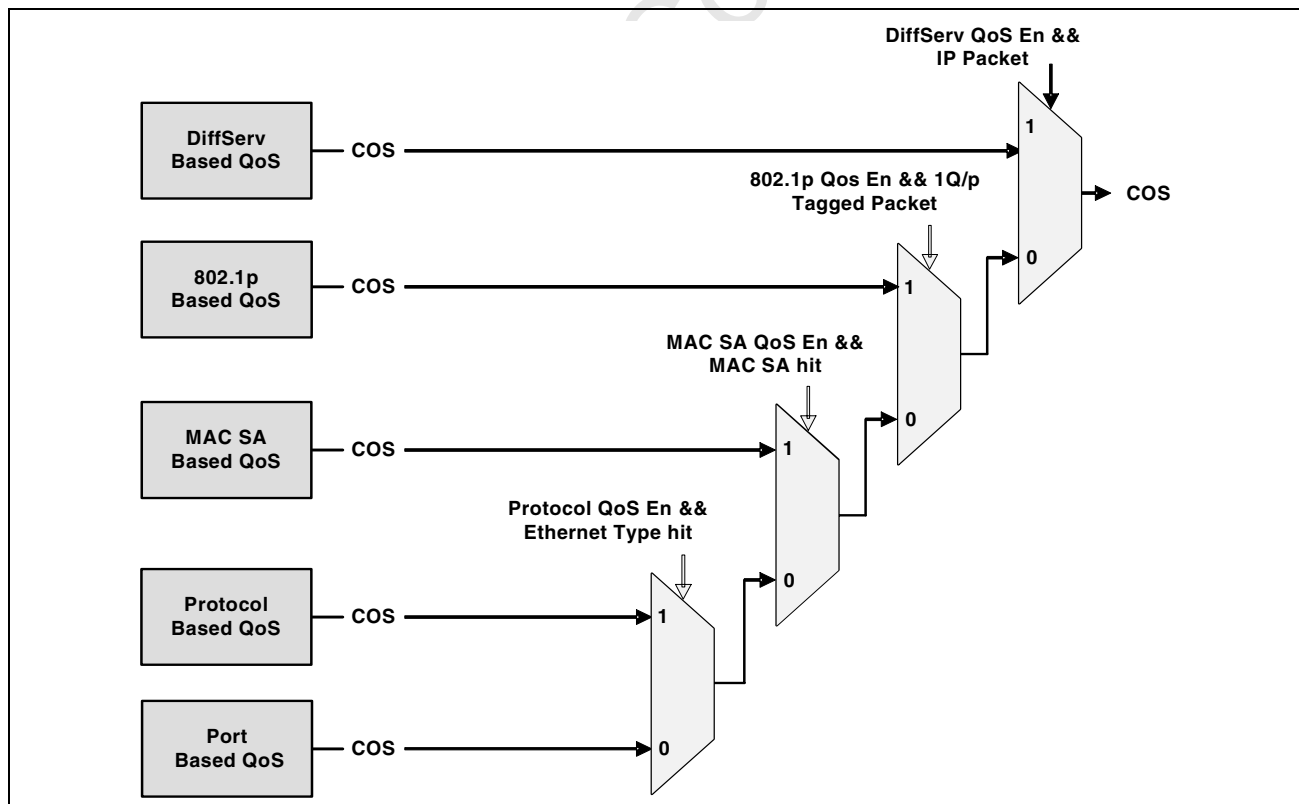

**Figure 3:  First Level QoS Resolution Tree**

# Reason Code Based QoS

When the IMP port is configured as the management port, the BCM53242M provides a Reason Code Based QoS for packets being forwarded to the CPU through the IMP port. When the IMP port is configured as a regular data port, the packets are forwarded based on the QoS schemes mentioned above.

Table 1 lists the conditions where packets can be forwarded to the CPU, descriptions, and their default QoS levels. Note that the default QoS values are configurable (see Table 277: "QoS Reason Code Enable Register (Page 30h: Address 58h–59h)," on page 293). The QoS value for Mirroring and SA Learning conditions must be programmed with a lower, or equal value, compared to the other conditions. This prevents out-of-order flow delivery of identical packets to the CPU.

*Table 1:  Reasons and QoS for CPU Traffic*

| Condition | Description | Default QoS level |
|---|---|---|
| Mirroring | The packet is forwarded (copied) through the IMP port because it needs to be mirrored to the CPU as the capturing port. | 0 |
| SA learning | The packet is forwarded through the IMP port because the SA must be learned by the CPU. | 0 |
| Switching | The packet is forwarded through the IMP port, either because the CPU is one of the intended destination hosts of the packet, or because the switch logic determines to flood the packet to all potential destinations. | 2 |
| Protocol Termination | The packet is forwarded through the IMP port because it implies an IEEE 802.1 defined L2 protocol that needs to be terminated by the CPU. | 3 |
| Protocol Snooping | The packet is forwarded through the IMP port because it implies an L3 or application level protocol that needs to be monitored by the CPU for network security or operation efficiency. | 2 |
| Exception Processing/ Flooding | The packet is forwarded through the IMP port for some special processing even though the CPU is not the intended destination or because the switch makes the flooding decision to reach all potential destinations. | 1 |

The Figure 4 shows the complete QoS Resolution tree structure.
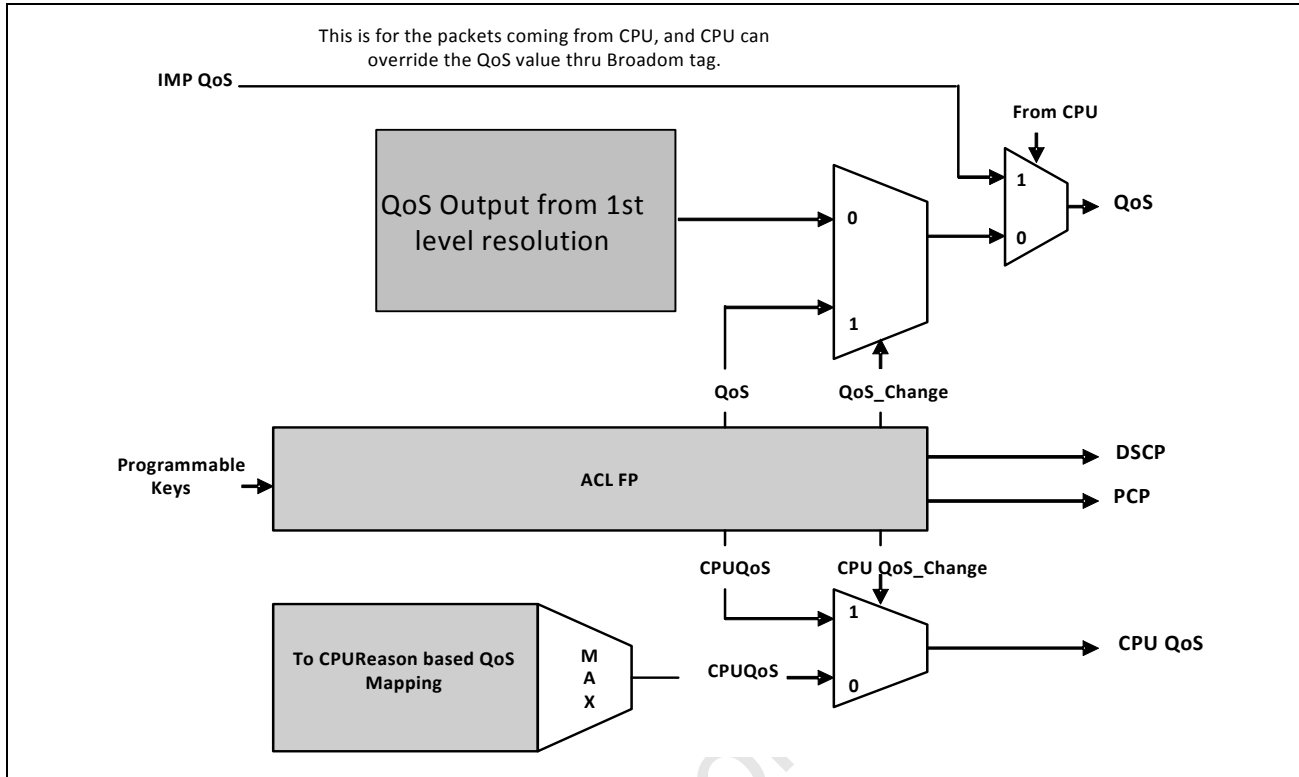

**Figure 4:  Final level QoS Resolution Tree**

# Port-Based VLANs

The port-based virtual LAN (VLAN) feature partitions the switching ports into virtual private domains designated on a per port basis. Data switching outside of the port's private domain is not allowed. The BCM53242M provides flexible VLAN configuration for each ingress (receiving) port.

The port-based VLAN feature works as a filter, filtering out traffic destined to nonprivate domain ports. The private domain ports are selected for each ingress port. Because the port selection is individual to each ingress port, it is possible for two ingress ports to not be granted bi-directional access. For each received packet, the ARL resolves the DA and obtains a forwarding vector (list of ports to which the frame shall be forwarded). The ARL then applies the VLAN filter to the forwarding vector, effectively masking out the nonprivate domain ports. The frame is only forwarded to those ports that meet the ARL table criteria, as well as the port-based VLAN criteria.

# 802.1Q VLANs

The BCM53242M supports IEEE 802.1Q VLAN and up to approximately 4K VLAN table entries that reside in the internal embedded memory. Once the VLAN table is programmed and maintained by the CPU, the BCM53242M will autonomously handle all protocol operations. These actions include the stripping or adding of the 802.1Q tag depending on the requirements of the individual transmitting port. It also performs all VLAN and MAC L2 lookups necessary to determine the correct packet routing.

# MAC-based VLANs

The BCM53242M supports MAC-based VLAN and up to 512 VLAN table entries that reside in the internal embedded memory. When the MAC-based VLAN is enabled, the VID is derived through the mapping table indexed by the MAC Source Address field embedded in the incoming packet. This mapping can be enabled/disabled per port, but the mapping table is configured globally. Once the VLAN mapping table is programmed and maintained by the CPU, the BCM53242M will autonomously handle all operations of the protocol.

# Protocol-based VLANs

The BCM53242M supports Protocol-based VLAN and up to 16 VLAN table entries that reside in the internal embedded memory. When Protocol-based VLAN is enabled, the VID is derived through the mapping table indexed by the EtherType field embedded in the incoming packet. This mapping can be enabled/disabled per port, but the mapping table is configured globally. Once the VLAN mapping table is programmed and maintained by the CPU, the BCM53242M will autonomously handle all operations of the protocol.

# Flow-based VLANs

The BCM53242M supports Flow-based VLAN. For more details, see "VID Replacement" on page 74.

# Customer-Tag-Based VLANs

The BCM53242M supports customer-tag-based VLANs and up to 4K VLAN table entries that reside in the internal embedded memory. When customer-tag-based VLAN is enabled, the VID is derived through the mapping table indexed by the customer-tag VID embedded in the incoming packet. Each mapping entry may be configured for VLAN appending (Double Tagging) or VLAN replacement (VLAN Translation) operation. Once the VLAN mapping table is programmed and maintained by the CPU, the BCM53242M will autonomously handle all operations.

The Figure 5 shows the VLAN resolution tree.
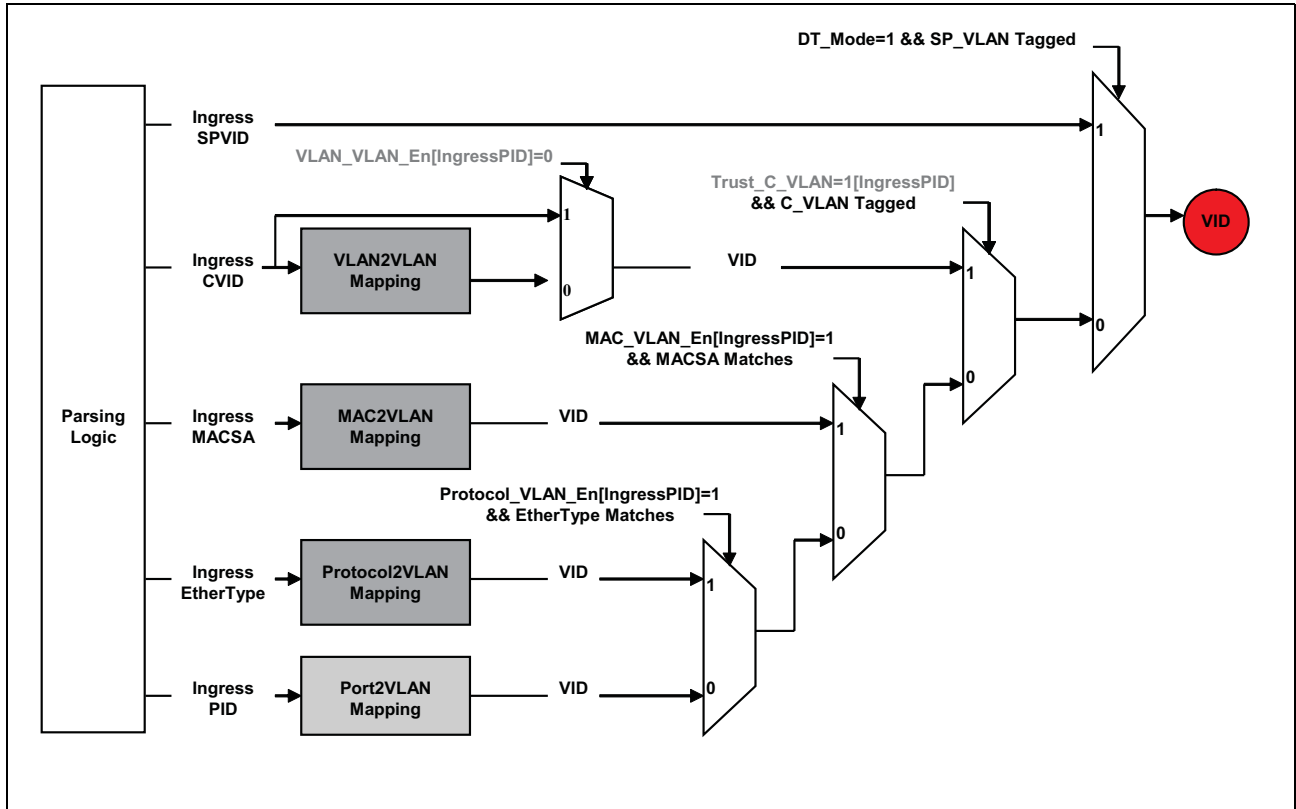

**Figure 5: VLAN Resolution Tree**

# Double Tagging

BCM53242M can be configured to operate either in Double Tagging mode for Edge Access Network Switching applications, or in Nondouble Tagging mode for traditional Local Area Network Switching applications. The Double Tagging mode is also referred as QinQ.

In **Double Tagging** mode,

- An Ethernet port can be configured either as a Network-Network Interface (NNI) port or as a User-Network Interface (UNI) port.
- There are four possible traffic profiles. Each possible traffic profile is described below, and illustrated in diagrams.
  - Incoming packets from NNI, and being forwarded to NNI (applies to Edge Access application)
  - Incoming packets from UNI, and being forwarded to NNI (applies to Edge Access application)
  - Incoming packets from NNI, and being forwarded to UNI
  - Incoming packets from UNI, and being forwarded to UNI

## NNI to NNI

The numbered process described below corresponds to the number in the diagram.

1.  Over a NNI/NNI link, all incoming packets are expected to have a Service Provider (SP) Tag for normal switching traffic forwarding or untagged for peer CPU communication across the NNI link. (C-tagged (customer) or Priority-tagged packets are not supposed to be forwarded across a NNI link.

2.  VLAN table is dedicated for Service Provider domain VLAN control.(The VID used to index the VLAN table is Service Provider Control for packet forwarding and learning operation, and the untag control can strip SP_Tag only.)

3.  With the Double Tagging (QinQ) process being performed, the VLAN translation operations are performed concurrently, either through the ingress VLAN remapping operations, or through the CFP action with the egress VLAN remapping operations.

4.  Local CPU generated packets (incoming packets through IMP port with Broadcom tag) have options to preserve the untagged status or to be processed as normal input packets.

Figure 6 shows how the extra (SP) tag is added to the incoming packets (tagged or untagged), and how the added tag can be output as is or be replaced.
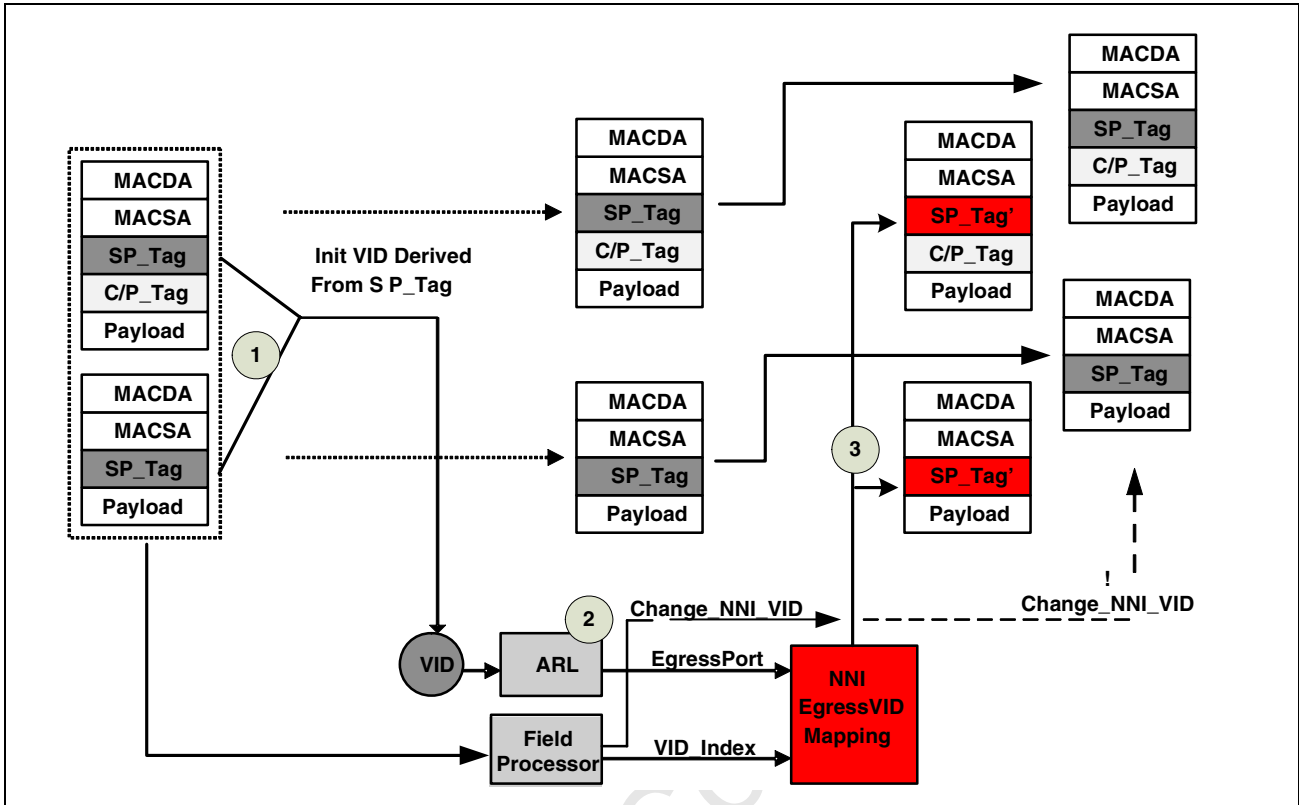

**Figure 6:  NNI to NNI Tag Handling**

## UNI to NNI

The numbered process described below corresponds to the number in the diagram.

1.  Over a UNI/NNI link, incoming packets can be Untagged, Priority tagged, or C tagged. (SP-tagged packets should not be forwarded across an UNI link.

2.  When an incoming packet from a UNI (customer) port is received, the packet is processed through the initial VID generation process (Port/ Protocol/ MACSA/ C_VID-based mapping) to generate an SP tag and the SP tag is used to access the ARL table.

3.  If the process is QinQ (double tagging or VLAN translation), the SP tag can be added as an outer tag, or the SP tag can be used to replace the original customer tag.

4.  With the Double Tagging (QinQ) process being performed, the VLAN translation operations are performed through the CFP action with the egress VLAN remapping operations. If the matched rule indicates VID is present, the SP tag is replaced with the newly mapped SP tag at the NNI port for transmission.

5.  Local CPU generated packets (incoming packets through IMP port with Broadcom tag) have options to preserve the untagged status or to be processed as normal input packets.

Figure 7 shows how the extra (SP) tag is added to the incoming packets (tagged or untagged), and how the added tag can be output as is or be replaced.

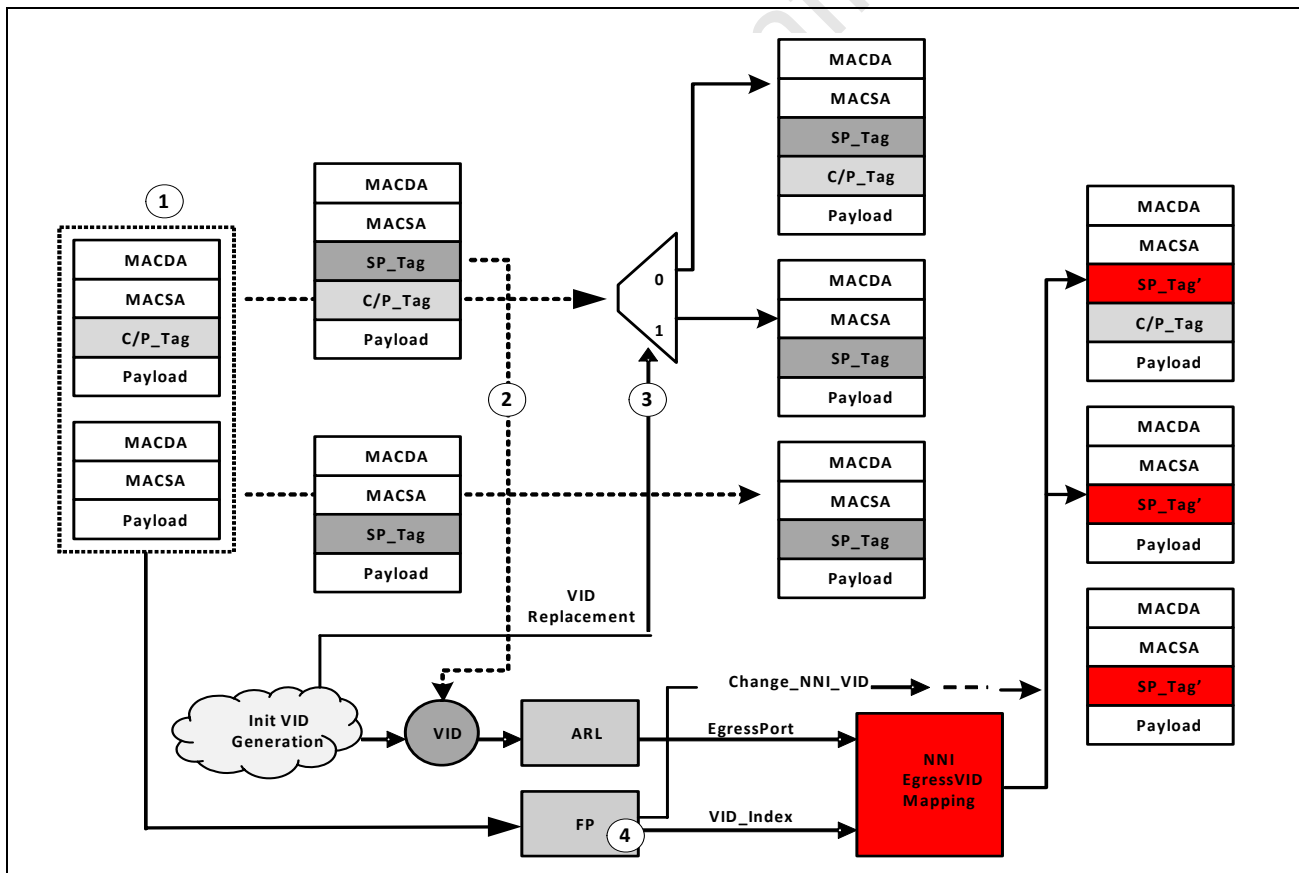

**Figure 7:  UNI to NNI**

# NNI to UNI

The numbered process described below corresponds to the number in the diagram.

1.  Over a NNI/UNI link, all incoming packets are expected to have a Service Provider (SP) Tag for normal switching traffic forwarding or untagged for peer CPU communication across the NNI link. (C-tagged (customer) or Priority-tagged packets are not supposed to be forwarded across a NNI link.

2.  VLAN table is dedicated for Service Provider domain VLAN control. The VID used to index the VLAN table is Service Provider Control for packet forwarding and learning operation, and the untag control can strip SP_Tag only.

3.  With the Double Tagging (QinQ) process being performed, the VLAN translation operations are performed concurrently, either through the ingress VLAN remapping operations, or through the CFP action with the egress VLAN remapping operations.

4.  Local CPU generated packets (incoming packets through the IMP port with a Broadcom tag) have options to preserve the untagged status or to be processed as normal input packets.

Figure 8 shows how the extra (SP) tag is added to the incoming packets (tagged or untagged), and how the added tag can be output as is or be replaced.

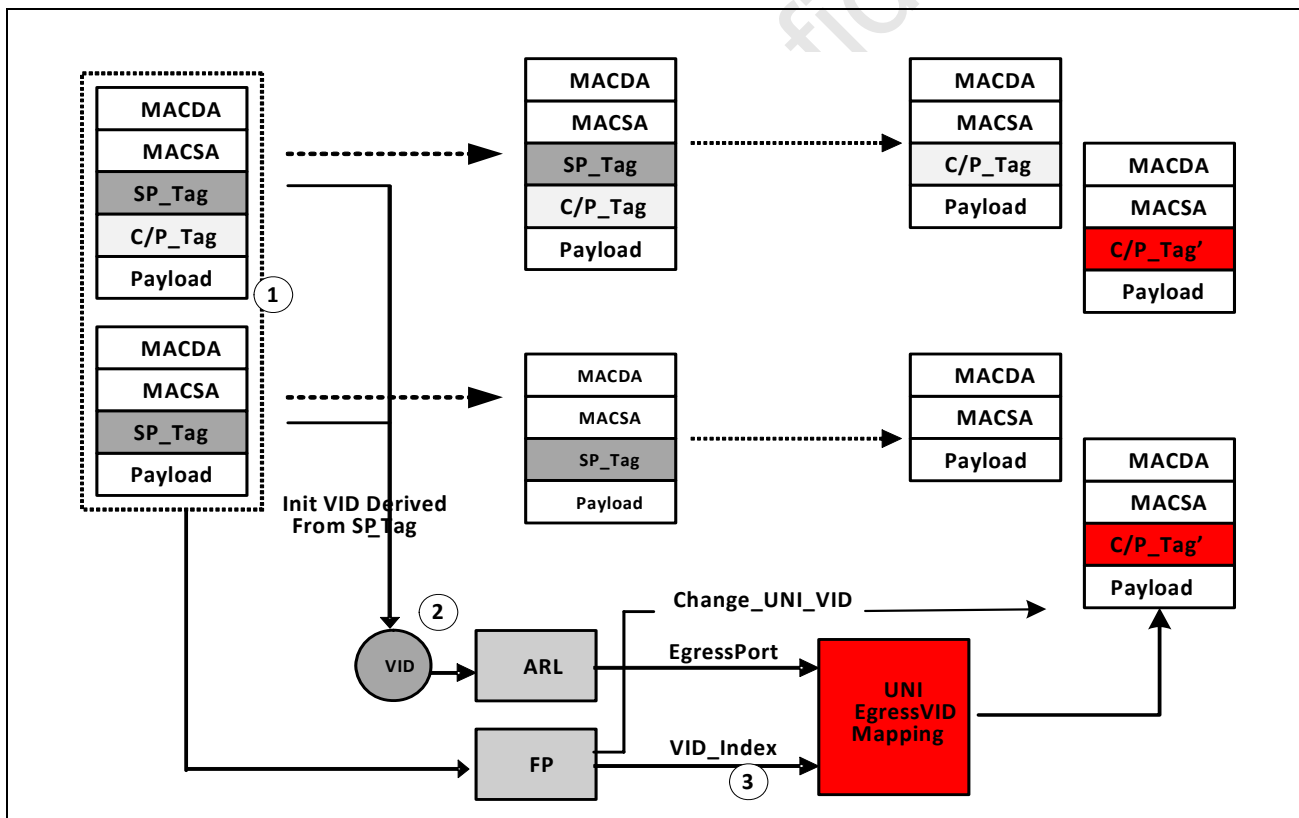

**Figure 8:  NNI to UNI**

### UNI to UNI

The numbered process described below corresponds to the number in the diagram.

1. Over a UNI/UNI link, incoming packets can be Untagged, Priority tagged, or C tagged. (SP-tagged packets are not supposed to be forwarded across a UNI link.

2. VLAN table is dedicated for Service Provider domain VLAN control. (The VID used to index the VLAN table is Service Provider Control for packet forwarding and learning operation, and the untag control can strip SP_Tag only.)

3. With the Double Tagging (QinQ) process being performed, the VLAN translation operations are performed concurrently, either through the ingress VLAN remapping operations, or through the CFP action with the egress VLAN remapping operations.

4. Local CPU generated packets (incoming packets through IMP port with Broadcom tag) have options to preserve the untagged status or to be processed as normal input packets.

Figure 9 shows how the extra (SP) tag is added to the incoming packets (tagged or untagged), and how the added tag can be output as is or be replaced.

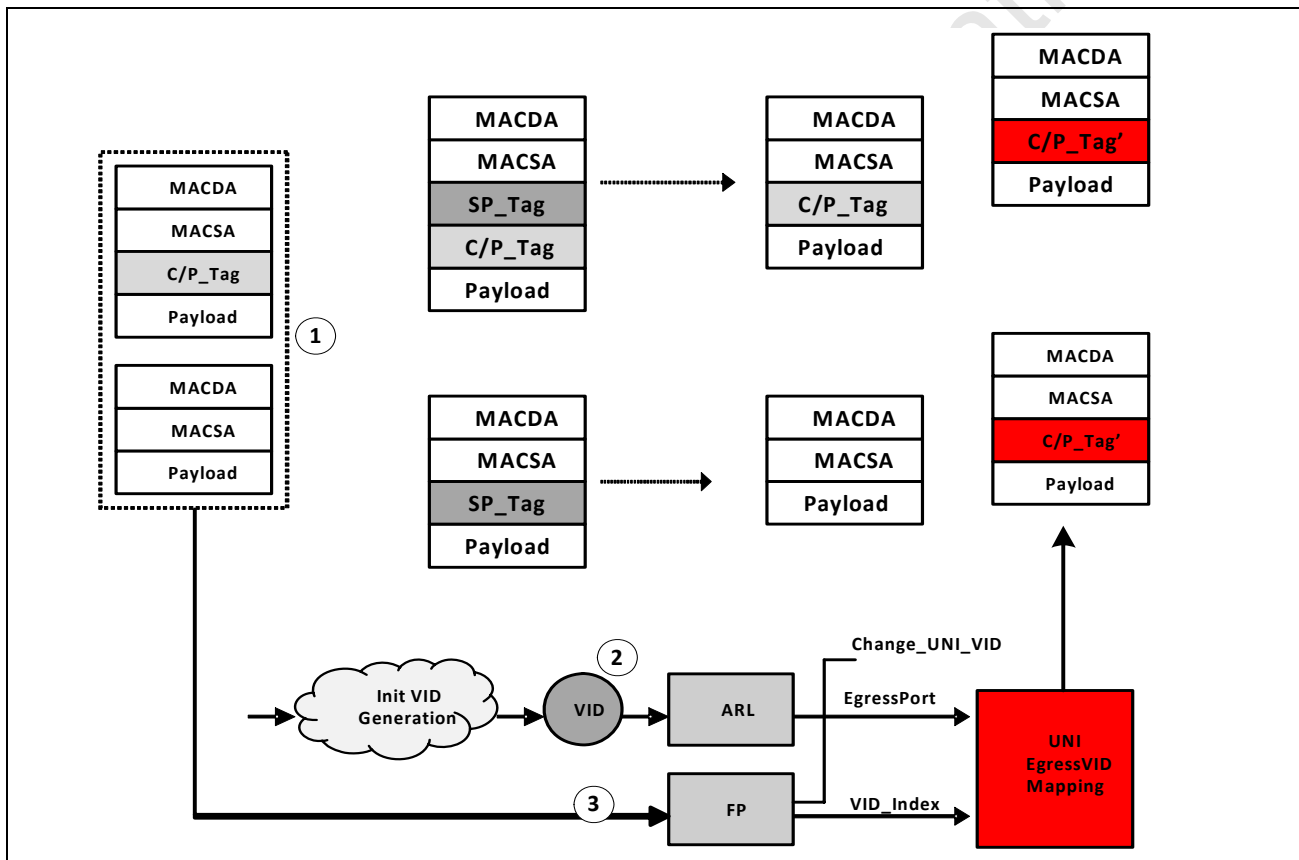

**Figure 9:  UNI to UNI**

In **Non _ Double Tagging** mode, the following definitions will be used throughout the description of the Non-Double Tagging operation. See Figure 10.

• All Ethernet ports are treated same (as if they are all UNI ports).

• Incoming packets can be Untagged, Priority tagged, or C tagged. (SP-tagged packets are not supposed to be forwarded across an UNI link.)

- The VLAN Table is dedicated for Customer domain VLAN control. (The VID used to index the VLAN Table is Customer's property for packet forwarding and learning operations)

- Local CPU-generated packets have option to preserve the CPU intended untag status.

- The VLAN translation operation may be performed, either through the ingress VLAN remapping operations or through the CFP action with the egress VLAN remapping operations.

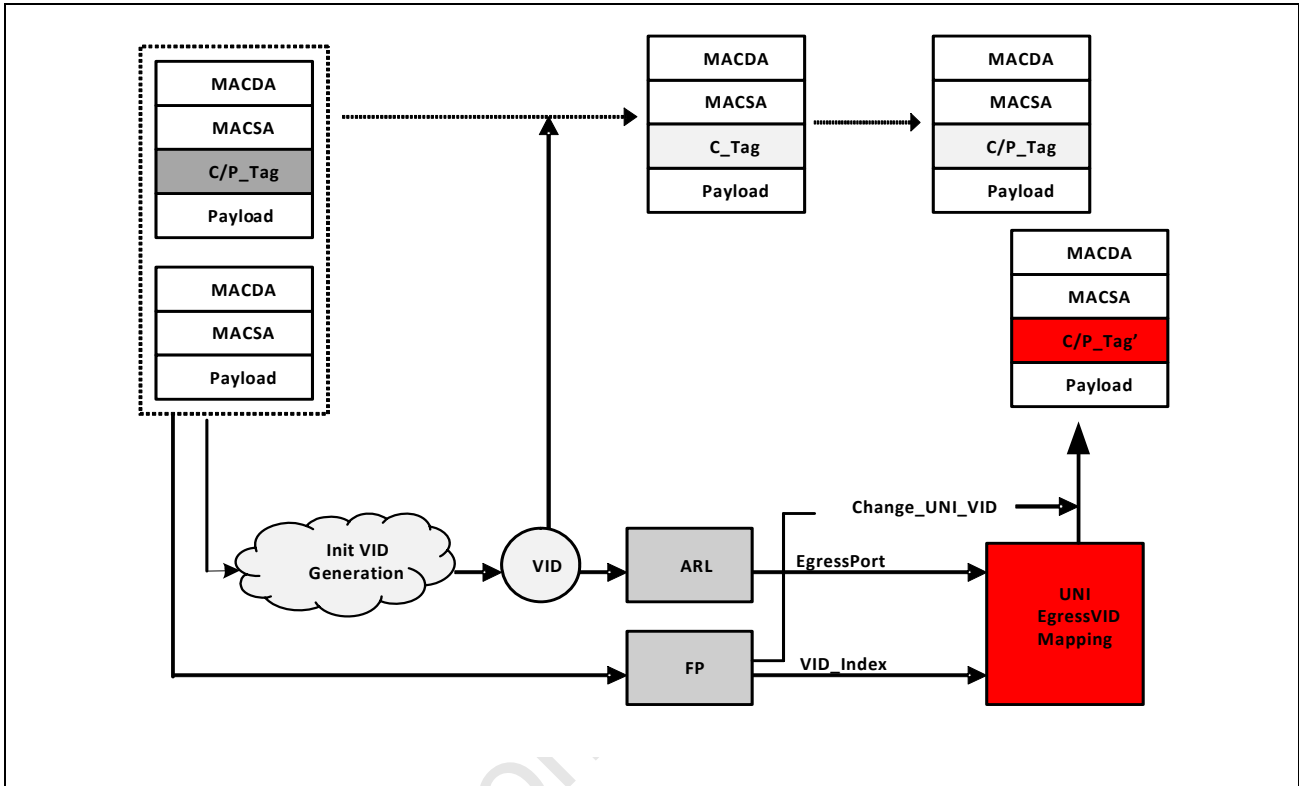

**Figure 10: Non_Double Tagging Mode UNI to UNI**

# Link Aggregation

The BCM53242M supports MAC-based aggregation. The aggregation feature allows up to eight ports to be grouped together as a single-link connection between two switch devices. This increases the effective bandwidth through a link and provides redundancy. BCM53242M allows up to 14 aggregation groups. Aggregations are composed of predetermined ports and can be enabled via a register. Ports within an aggregation group must be of the same linked speed. By performing a dynamic hashing algorithm on the MAC address, each packet destined for the aggregation is forwarded to one of the valid ports within the aggregation group. This method has several key advantages. By dynamically performing this function, the traffic patterns can be more balanced across the ports within an aggregation. In addition, the MAC-based algorithm provides dynamic failover. If a port within an aggregation group fails, the other ports within the aggregation automatically assume all traffic designated for the aggregation. It allows for a seamless, automatic redundancy scheme. This hashing function can be performed on either the DA, SA, IPv4DA, IPv4SA, or any combination of four depending on the Aggregation Hash Selector bit.

**Figure 11: Link Aggregation**

# Rate Control

Forwarding broadcast traffic consumes switch resources, which can negatively impact the forwarding of other traffic. The rate-based broadcast storm suppression mechanism is used to protect regular traffic from an over abundance of broadcast or multicast traffic. This feature monitors the rate of ingressed traffic of programmable packet types. If the rates of these packet types exceed the programmable maximum rate, the packets are dropped or flow control is activated.

The broadcast storm mechanism works on a credit-based rate system that figuratively uses a bucket to track the bandwidth of each port (see Figure 12 on page 53) on the basis of egress or ingress data flow. Credit is continually added to the bucket at a programmable Bucket Bit Rate. Credit is decremented from the bucket whenever one of the programmable packet types is ingressed at the port. If no packets are ingressed for a considerable length of time, the bucket credit will continue to increase up to a programmable maximum bucket size. If a heavy burst of traffic is suddenly ingressed at the port, the bucket credit will become drained. When the bucket is emptied, incoming traffic will be constrained to the Bucket Bit Rate, the rate at which credit is added to the bucket. At this point, excess packets will be either dropped or deterred via flow control.

## Egress Rate Control

The egress rate control employs a single bucket system to track the bandwidth usage of all egressed packets. Each port has the queue structure as shown in Figure 2 on page 38, each queue has a shaper can control the egress rate, and each port has a shaper can control the egress rate per port basis. The simple but effective method can be enabled on a per-port and per queue basis with a granularity of 64Kbps.
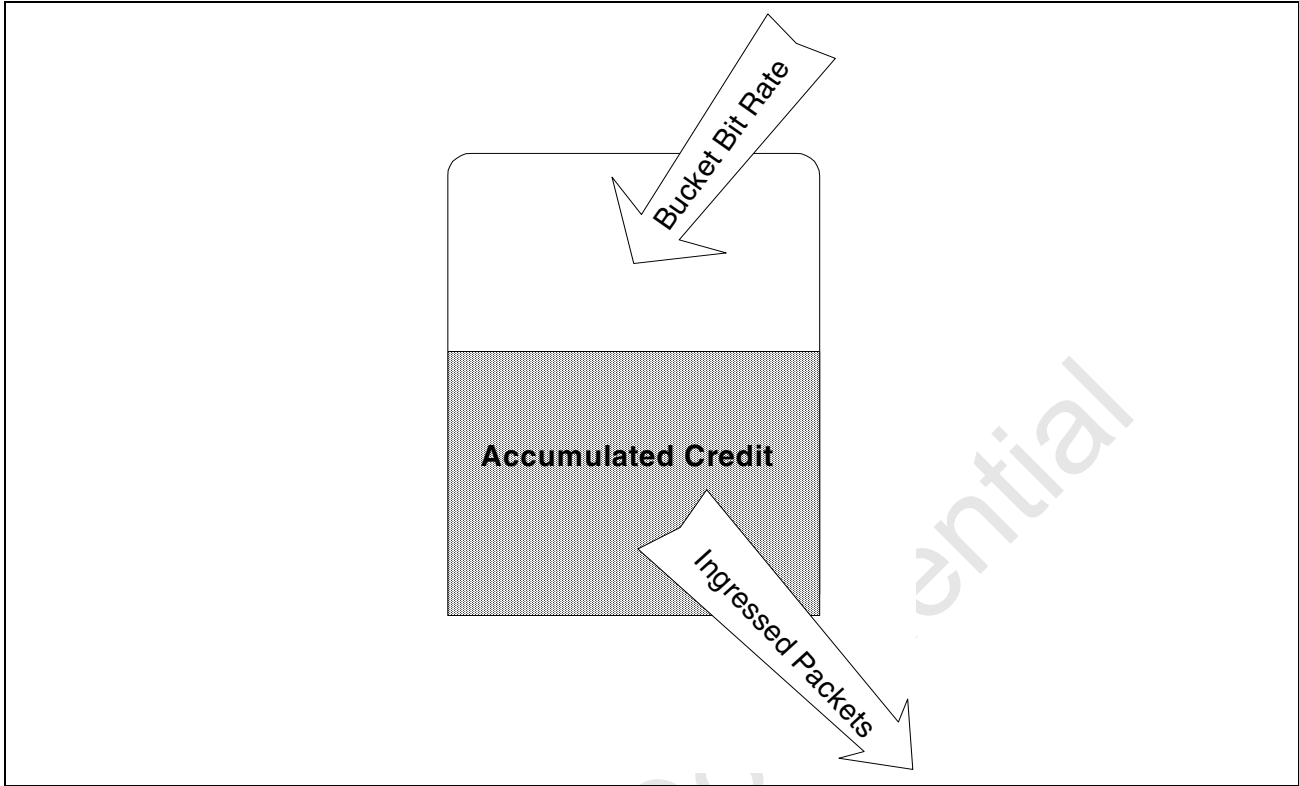

**Figure 12:  Ingress Bucket Flow**

## Ingress Rate Control: The Three-Bucket System

For added flexibility, the BCM53242M ingress rate control employs three buckets to track the rate of ingressed packets. Each of the three buckets, Bucket 0, Bucket 1, and Bucket 2, can be programmed to monitor different packet types. For example, Bucket 0 could monitor broadcast packets, while Bucket 1 and Bucket 2 monitor other types of packets. Multiple packet types can be monitored by each bucket, and a packet type can be monitored by both buckets.

The rates of each bucket can be programmed individually. For example, the broadcast packets of Bucket 0 could have a maximum rate of 3 Mbps, whereas the multicast packets of Bucket 1 could be allowed up to 80 Mbps, with the granularity of each bucket at 64 Kbps. The size of each bucket can be programmed individually as well. This determines the maximum credit than can accumulate in each bucket. The bucket rate can be specified as an absolute rate or a normalized rate, which is scaled to the link speed of the given ingress port. The rate control can be enabled or disabled on a per-port basis.

# Protected Ports

The Protected Ports feature allows certain ports to be designated as protected. All other ports are unprotected. Traffic between protected port group members is blocked. However, protected ports are able to send traffic to unprotected ports. Unprotected ports can send traffic to any port. There are the following application benefits:

- Aggregator: All of the available ports are designated as protected ports, except a single aggregator port. All traffic incoming to the protected ports will not be sent within the protected ports group. Any flooded traffic is forwarded only to the aggregator port.

- To prevent unsecured ports from monitoring important information on a server port, the server port and unsecured ports are designated as protected. The unsecured ports will not be able to receive traffic from the server port.

# Port Mirroring

The BCM53242M supports port mirroring, allowing ingress and/or egress traffic to be monitored by a single port that is defined as mirror capture port. The mirror capture port can be any 10/100 port, 10/100/1000 port or the Management port. The BCM53242M can be configured to mirror the ingress traffic and/or egress traffic of any other port(s). Mirroring multiple ports is possible, but can create congestion at the mirror capture port. Filtering can be used to decrease the port congestion. In addition, each ingress port can be configured to randomly pick the received packets and send to the CPU for Sflow packet sampling purpose.

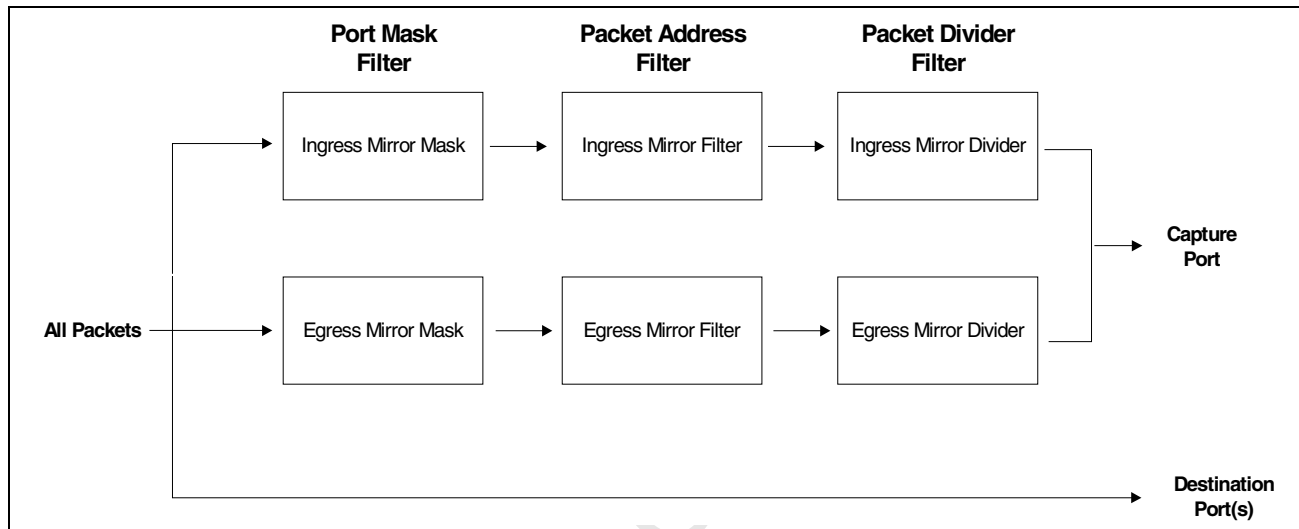

**Figure 13:  Mirror Filter Flow**

# Mirror Filtering Rules

Mirror Filtering Rules consist of a set of three filter operations

- "Port Mask Filter"
- "Packet Address Filter"
- "Packet Divider Filter" on page 56

## Port Mask Filter

The most basic of filtering, the Port Mask filter, allows for the selection of a limited number of ports to be monitored based on egress or ingress packet flow. Any number of ingress/egress ports can be programmed to be mirrored, but bandwidth restrictions on the one mirror capture port should be taken under advisement, so as not to cause congestion or packet loss.

## Packet Address Filter

The Packet Address filter further filters the mirrored ingress/egress frames based on the following criteria:

- Mirror all received frames

- Mirror received frames with DA = x
- Mirror received frames with SA = x

Where x is programmed 48-bit MAC address.

## Packet Divider Filter

The Packet Divider filter allows further statistical sampling to be performed. Only one out of every n ingress/egress frames is forwarded to the mirror capture port, where n is a programmable integer. Combined with the packet address filter it allows the following capabilities:

- Mirror every $n^{th}$ received frame
- Mirror every $n^{th}$ received frame with DA = x
- Mirror every $n^{th}$ received frame with SA = x

# IGMP and MLD Snooping

The BCM53242M supports IP layer IGMP and MLD Snooping. When IGMP and MLD is enabled, the BCM53242M forwards IGMP and MLD frames to the frame management port. The external management entity programs the multicast membership information to the ARL table.

When the IP layer IGMP and MLD snooping is enabled, a frame with a value of 2 in the IP header protocol field and not a IGMP query will be forwarded to the CPU port. The Management CPU can then determine, from the IGMP control packets, which port should participate in the multi group session. The management CPU proactively programs the multicast address in the ARL table or the Multiport Address Entries.

# Jumbo Frame Support

The BCM53242M can receive and transmit frames of extended length on all linked ports. Referred to as jumbo frames, these packets may be longer than 1518 bytes (when untagged), up to 2048 bytes. This feature is automatically enabled upon power up.

# 802.1x Port-Based Security

IEEE 802.1x is a port-based authentication protocol based on the exchange of Extensive Authentication Protocol over LAN (EAPOL) packets. When enabled the BCM53242M 802.1x feature forwards these packet types to the management CPU. Based on the receipt of these packets, the management CPU has the prerogative to modify per-port 802.1x-based security status.

When 802.1x feature is enabled, all traffic is blocked except EAPOL and ARP frames. The default state for all switch ports is a nonforwarding state. As ports become authenticated via the management CPU, these port states are modified via the CPU. Thus packet forwarding can commence.

# Dynamic Secure MAC Mode

Another security feature that can be used in with the 802.1x feature, the Dynamic Secure MAC Mode allows the management CPU control of the dynamic Source Address (SA) learning process. When enabled, the maximum number of learned SA ARL entries is set. When this maximum has been reached, the learning process is no longer active. Incoming frames with an unknown source address will be dropped without dynamically learning them into the ARL table. The learning process will continue when the aging process removes existing learned entries from the ARL table. This feature does not account for statically programmed ARL entries via the management CPU.

# Address Management

The BCM53242M Address Resolution Logic contains the following features:

*   Two bins per bucket address table configuration.
*   Hashing of the MAC/VID address to generate the address table pointer.

The address management unit of the BCM53242M provides wire-speed learning and recognition functions. The address table supports 8K unicast/mulitcast addresses using on-chip memory.

## Address Table Organization

The MAC addresses are stored in embedded SRAM. Each bucket contains two entries (or bins). The address table has 4K buckets.
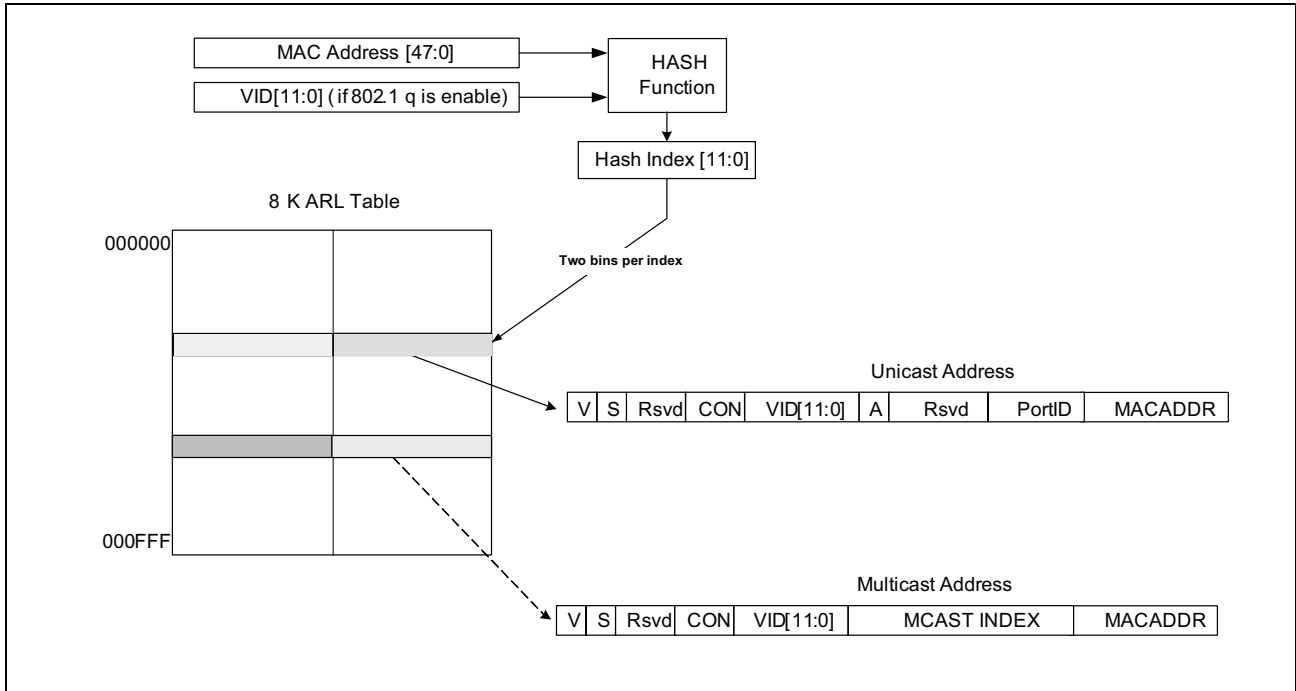

**Figure 14:  BCM53242M Address Table Organization**

The index to the address table is computed using a hash algorithm based on the MAC address and the VLAN ID (VID) if enabled. The hash algorithm uses the CRC-CCITT polynomial. The input to the hash is reduced to a 16-bit CRC hash value. Bits 11:0 of the hash are used as an index to the 4K buckets of the address table.

The CRC-CCITT polynomial is:

$x^{16}+x^{12}+x^5+1$

# Address Learning

Information is gathered from received unicast packets, and learned or stored for the future purpose of forwarding frames addressed to the receiving port. During the receive process the frame information, such as the source address (SA) and VID, is saved until completion of the packet. An entry is created in the ARL table memory if the following conditions are met:

- The packet has been received without error
- The packet is of legal length
- The packet has a unicast SA
- If using 802.1Q VLAN, the packet is from a SA that belongs to the indicated VLAN domain
- The packet does not have a reserved multicast destination address
- There is free space available in memory to which the hashed index points.

When unicast packets are dynamically learned, the VALID bit is set, the AGE bit is set, and the STATIC bit is cleared in the entry.

# Reserved Addresses

The BCM53242M treats certain of the 802.1 administered reserved multicast destination addresses in specific ways, dependent on the mode of operation. Packets identified with these destination addresses are handled uniquely since they are designed for special functions.

*Table 2:  Behavior for Reserved Multicast Addresses*

| MAC Address | Function | 802.1 Specified Action | Unmanaged Mode Action (Note 1) | Managed Mode Action |
|---|---|---|---|---|
| 01-80-C2-00-00-00 | Bridge Group Address | Drop Frame | Forward Frame | Forward Frame to Frame Management Port Only (Note 2) |
| 01-80-C2-00-00-01 | IEEE Std 802.3x MAC Control Frame | Drop Frame | Receive MAC Determines if Valid PAUSE Frame and acts accordingly | Receive MAC Determines if Valid PAUSE Frame and acts accordingly |
| 01-80-C2-00-00-02 | RESERVED | Drop Frame | Drop Frame | Forward Frame to Management Port Only |
| 01-80-C2-00-00-03 | RESERVED | Drop Frame | Drop Frame | Forward Frame to Management Port Only |
| 01-80-C2-00-00-04~ 01-80-C2-00-00-0F | RESERVED | Drop Frame | Drop Frame | Forward Frame to Management Port Only |
| 01-80-C2-00-00-10 | All LANs Bridge Management Group Address | Forward Frame | Forward Frame | Forward Frame to all Ports Including Frame Management Port |
| 01-80-C2-00-00-20 | GMRP address | Forward Frame | Forward Frame | Forward Frame to all Ports Except Frame Management Port (Note 3) |
| 01-80-C2-00-00-21 | GVRP address | Forward Frame | Forward Frame | Forward Frame to all Ports Except Frame Management Port (Note 3) |
| 01-80-C2-00-00-22~ 01-80-C2-00-00-2F | RESERVED | Forward Frame | Forward Frame | Forward Frame to all Ports Except Frame Management Port |

*Table 2:  Behavior for Reserved Multicast Addresses  (Cont.)*

| MAC Address | Function | 802.1 Specified Action | Unmanaged Mode Action (Note 1) | Managed Mode Action |
|---|---|---|---|---|

Note:

1. Unmanaged Mode disables the frame management port option. The IMP does not receive frame data when in this mode. The MII port will be treated as a normal network port and have frames forwarded to it in accordance with the entries in the address table.

2. Frames with the reserved multicast address corresponding to the BridgeGroup Address (01-80-C2-00-00-00) are forwarded to the programmed Frame Management Port based on the contents of the BPDU Multicast Address Register (in the ARL Control Register Page). Changing this register from the default value causes frames with the new address to be forwarded to the Frame Management Port, and BPDUs are flooded to all ports except the Frame Management Port. The RX_BPDU_EN bit of Management Configuration Register must be enabled.

3. Frames with the reserved multicast address corresponding to the GMRP or GVRP Addresses (01-80-C2-00-00-20 or 01-80-C2-00-00-21) are forwarded to all ports except the source and Frame Management Ports. If the switch product implements either of these protocols, then the BCM53242M should be programmed to use the Managed Mode, and the multicast address should be instantiated in the address table, with a Port ID that forwards the frame to the chip and port with the defined Frame Management Port.

# Learning

During the receive process the source address (SA) of the packet is saved until completion of the packet. The address is stored in the address table memory if the following conditions are met:

- The packet is not from the Management port.
- The packet has been received without error.
- The packet is of legal length.
- The packet has a unicast address.
- There is a free space available in one of the two entries (STATIC=0 and VALID=0) in the bucket that the hashed address indexes to. If there is no free space available in the bucket, the address is not learned.

When learning, the MAC address and the source port ID is stored into the address table. The VALID bit is set, the AGE bit is set, and the STATIC bit is reset in the entry.

# Static Address

The BCM53242M supports static filtering entries that are created and updated by software through the Serial Management Port. Bridge management software can create these entries by directly writing the entry location of the buffer memory, and setting the STATIC bit of the entry. Static entries do not have new MAC addresses or port associations learned automatically, and are not aged out by the automatic internal aging process (i.e., the AGE bit is subject to aging and refreshing processes, however, the entry can only be invalidated by CPU.).

For instance, addresses associated with a switch's network ports and the management port should be instantiated as Static entries in the address table by the management processor, with the source port ID and as the physical management port. All the specific register information is temporary and subject to be change in the final version of the data sheet.

# Resolution

The destination address (DA) of the received packet is used by the address resolution function to search the address table and assign a destination port for the packet. The destination port is assigned by locating a matching address in the address table and selecting the source port identifier field as the destination port. The search for a matching address occurs only for unicast packets. The address resolution function for unicast packets proceeds as follows:

- The lower 12 bits of the DA are used as a pointer into the address table memory and both entries in the bucket are retrieved. The address resolution logic processes the two entries in parallel.
- If the valid indicator is set and the address stored at one of the locations matches the DA of the packet received, the port identifier is assigned to be the destination port of the packet.
- If the destination port matches the source port, the packet is not forwarded.
- If the valid indicator is not set or the address stored does not match the DA address of the packet, the packet is forwarded as a broadcast packet and will be transmitted to all other ports.

If SW_FWDG_MODE is Unmanaged, packets with the group address bit set in the DA are handled as follows:

- If the DA matches the globally assigned multicast address of the 802.3x MAC Control PAUSE frame of 01-80-C2-00-00-01, the packet is not forwarded.
- If the DA matches the Bridge Group Address, the packet is forwarded to all ports except the source port.
- If the DA matches one of the other globally assigned reserved address (between 01-80-C2-00-00-02 and 01-80-C2-00-00-0F), the packet is not forwarded.
- All other multicast and broadcast packets are forwarded to all ports except the source port and the Management Port.

If SW_FWDG_MODE is Managed, packets with the group address bit set in the DA are handled as follows:

- If the DA matches the globally assigned multicast address of the 802.3x MAC control PAUSE frame of 01-80-C2-00-00-01, the packet is not forwarded.
- If the DA matches one of the globally assigned reserved address (between 01-80-C2-00-00-00 and 01-80-C2-00-00-0F excluding 802.3x MAC Control PAUSE frame address), the packet is forwarded to the Management port.
- If the DA matches the All LANs Bridge Management Group Address of 01-80-C2-00-00-10, or the GARP addresses of 01-80-C2-00-00-20 to 01-80-C2-00-00-2F, the packet is forwarded to all ports except the source port and the Management Port.
- All other multicast and broadcast packets are forwarded to all ports except the source port. The Management Port can selectively have broadcast packets and/or multicast packets individually disabled based on the RX_MCST_DISABLE and RX_BCST_DISABLE bits in the Port Control Register for the IMP (MII).

# Hash Function

The address resolution logic incorporates a hash function to randomize storage location for the MAC address.

# ARL Mishs Options

When an ARL miss occurs, the BCM53242M allows for the programming of two registers to decide what to do with the ARL missed packet:

- MLF_FWD_MAP is for Multicast packet
- ULF_FWD_MAP is for unicast packet

When a unicast ARL miss occurs, the BCM53242M forwards it according to the ULF_FWD_MAP value. When a Multicast ARL miss occurs, the BCM53242M forwards it according to the MLF_FWD_MAP value.

# Bridge Management

BCM53242M provides the following services:

- 802.1D—Spanning Tree Protocol
- 802.1s—Multiple Spanning Trees
- 802.1W—Rapid Reconfiguration of Spanning Tree
- Bridge Management state register access through the CPU interface
- Bridge Protocol Data Unit (BPDU) frame forwarding through the CPU interface or the MII interface

## Spanning Tree Port State

The BCM53242M device supports the Spanning Tree Protocol (STP) by providing the spanning tree state in the Port Control Register for each of the network ports. Each Port Control Register (PCR) contains three bits dedicated to STP state (STP_STATE[2:0]) as well as additional bits to control the operation of the MAC port.

In the unmanaged compatible mode of operation (SW_FWDG_MODE = Unmanaged), the default state of the STP_STATE[2:0] bits are all 0s, and no spanning tree state is maintained. Write operations to the spanning tree state bits are ignored. Frames are forwarded based only on their DA. Known unicast address frames are forwarded to their single defined destination port, and unknown unicast, as well as all multicast/broadcast addressed frames, are flooded to all ports, with the exception of the management port, providing SW_FWDG_EN = 1. BPDU frames, are one of the 802.1 reserved multicast addresses that the unmanaged mode floods.

The BCM53242M reacts to the STP state bits as written by the management CPU, as described in the following sections (providing SW_FWDG_EN = 1).

### Disable

In this state, all frames received by the port are discarded. The port also does not forward any transmit frames, queued by either BCM53242M receive network ports, or frames cast by the management entity via the IMP. Addresses are not learned by ports in the Disabled state. This is the default state that the BCM53242M will power up in when SW_FWDG_MODE = Managed.

### Blocking

In this state, the MAC port forwards received BPDUs to the designated Management port (IMP). All other frames received by the port are discarded and the addresses are not learned. The port will also not forward any transmit frames, queued by other BCM53242M receive network ports.

## Listening

In this state, the MAC port forwards received BPDUs to the designated Management port (IMP). All other frames received by the port are discarded and the addresses are not learned. The port also does not forward any transmit frames, queued by other BCM53242M receive network ports, but transmits frames cast by the management entity, via the MSP or IMP, as expected (such as BPDUs). Note that the Learning and Listening states of all BCM53242M ports are identical. The external management processor running the STP algorithm must distinguish these two states using the STP algorithm, but is able to store the Learning and Listening state information into the BCM53242M for consistency.

## Learning

In this state the MAC port forwards received BPDUs to the Management port, transmits BPDUs sent into the Management port, and learns MAC addresses. All other frames received by the port are discarded.

## Forwarding

In this state the MAC port forwards received BPDUs to the Management port, transmits BPDUs sent into the Management port, forwards all other frames and learns all incoming frame's MAC addresses.

*Table 3:  Spanning Tree State*

| Spanning Tree State | Receive BPDU | Transmit BPDU | Normal Frame | Learning State | STP_State |
|---|---|---|---|---|---|
| No Spanning Tree OR Spanning Tree Disable | Treated as Multicast | Flood to all ports | Forward | Learn | 000 |
| Disable State | Disabled | Disabled | Don't Forward | Don't Learn | 001 |
| Blocking State | Forward to Management | Disabled | Don't Forward | Don't Learn | 010 |
| Listening State | Forward to Management | Enabled | Don't Forward | Don't Learn | 011 |
| Learning State | Forward to Management | Enabled | Don't Forward | Learn | 100 |
| Forwarding State | Forward to Management | Enabled | Forward | Learn | 101 |

The Multiple Spanning Tree Protocol (MSTP), which uses the Rapid Spanning Tree protocol (RSTP) to provide rapid convergence, enables VLANs to be grouped into a spanning-tree instance, provides for multiple forwarding paths for data traffic, and enables load balancing. It improves the fault tolerance of the network because a failure in one instance (forwarding path) does not affect other instances (forwarding paths). The most common initial deployment of MSTP and RSTP is in the backbone and distribution layers of a Layer 2 switched network; this deployment provides the highly-available network required in a service-provider environment. Both RSTP and MSTP improve the operation of the spanning tree while maintaining backward compatibility with equipment that is based on the (original) 802.1D spanning tree. The BCM53242M can support up to 256 Spanning Trees.

The BCM53242M also supports per-port aging.

# Management Frames

Management frames received by the BCM53242M are forwarded to the Bridge Management entity (an external CPU or microcontroller) through the GMII/MII Port. When the GMII/MII is used as the interface to the external management subsystem the port is referred to as the In-band Management Port (IMP). When operating in the unmanaged mode, management frames are treated differently. The following frames are forwarded to the Bridge Management entity in the BCM53242M mode:

- BPDU Frames—BPDUs are identified by the Bridge Group Address (01-80-C2-00-00-00) in the destination address field of a frame. The STP_STATE bits in the Port Control Register must be configured to permit BPDU reception on a particular port. A BPDU received on such a port will be forwarded, with the Port ID of the receiving port, to the port configured in the Management Port ID register.

- Reserved Multicast Addressed Frames—Frames with 802.1 administered Reserved Multicast Addresses (between 01-80-C2-00-00-02 and 01-80-C2-00-00-0F in their DA field are forwarded only to the Management Port, with a header which includes the Port ID of the port from which the frame was received. Frames with thee All LANs Bridge Management Group Address (01-80-C2-00-00-10) as the DA are forwarded to all ports, with the Management Port again receiving the header information to identify the Port ID from which the frame was received.

- Directed Management Agent Frames—Packets with the DA equal to one of the MAC addresses associated with the Management Port. These addresses are generally entered as Static addresses by the management entity itself.

- Mirrored Frames—Ingress or egress port frames that have been assigned to be mirrored to the management port.

# Compact Field Processor

BCM53242M provides a TCAM based Compact Field Processor (CFP) to support ACL implementation and packet classification. CFP is a versatile filter and classification processor.

There are three CFP slices running in parallel in BCM53242M as shown in . As a result, multiple ContentAware processing can be executed per packet. The each CFP slice consists of Parser, Lookup Engine, Policy Engine, Metering/Statistic Engine, and Action Resolution Logic.

The input (key) to the CFP includes the predefined fields from the packet header, and/or user-defined fields within a packet. All these inputs are gathered at the receive port through the parser.

Up to 1K rules can be set for the parallel engines to search and assign the action to be taken when a match has been discovered. These rules can be distributed over the input ports in any combination. The actions supported by the BCM53242M are flooding, dropping, copying, changing the forward port map, adding forward port, and changing the priority, VID, and DSCP of a frame. The details of the actions are described in later paragraph.

Each CFP Engine (slice) consists of a Parser, a Lookup engine, a Policy engine, a Metering and Statistic engine and an Action Resolution engine.

- Parser assembles and extracts specified Ethernet standard field data and/or user-configurable UDF field data. Then, the Parser makes the assembled key available to the lookup engine. BCM53242M has

predefined key fields for each of three slices as shown in Table 4 on page 70, Table 5 on page 70, Table 6 on page 72, and Table 7 on page 72. The most well known packet header fields may be selected, as well as any field in the packet through User-Defined Field (UDF).

- Lookup engine, which performs lookup and outputs the address of the matched location. Lookup engine compares the input (combination of fields defined in each slice) with all the entries in the TCAM memory. The result of the comparison is the address for the entry that is 100 percent matched. If there is more than one matching entry, the entry with the lowest physical address is returned. In addition, the lookup engine also has a mask per entry that selects specific bits of each memory entry that are required to be an exact match with the incoming bits from the input. This provides flexibility by allowing the Don't Care fields in the input.

- Policy engine, which contains a list of actions for the matching rule in the ContentAware lookup engine. There are as many actions as rules. Each matching index from the Lookup Engine is mapped to an action in the Policy engine.

- Metering and Statistics engines, which perform policing and statistics collection.

- Action resolution engine, which resolves multiple/conflict matches. Based on the matching results from the Lookup Engine, three possible actions from each slice are input to the Action Resolution Logic. The priority of each slice can be configured. The Action Resolution Logic sorts out the each action from each slice, and implements all the non conflicting actions. For the conflicting actions, the Action Resolution Logic picks an action from the high-priority slices.

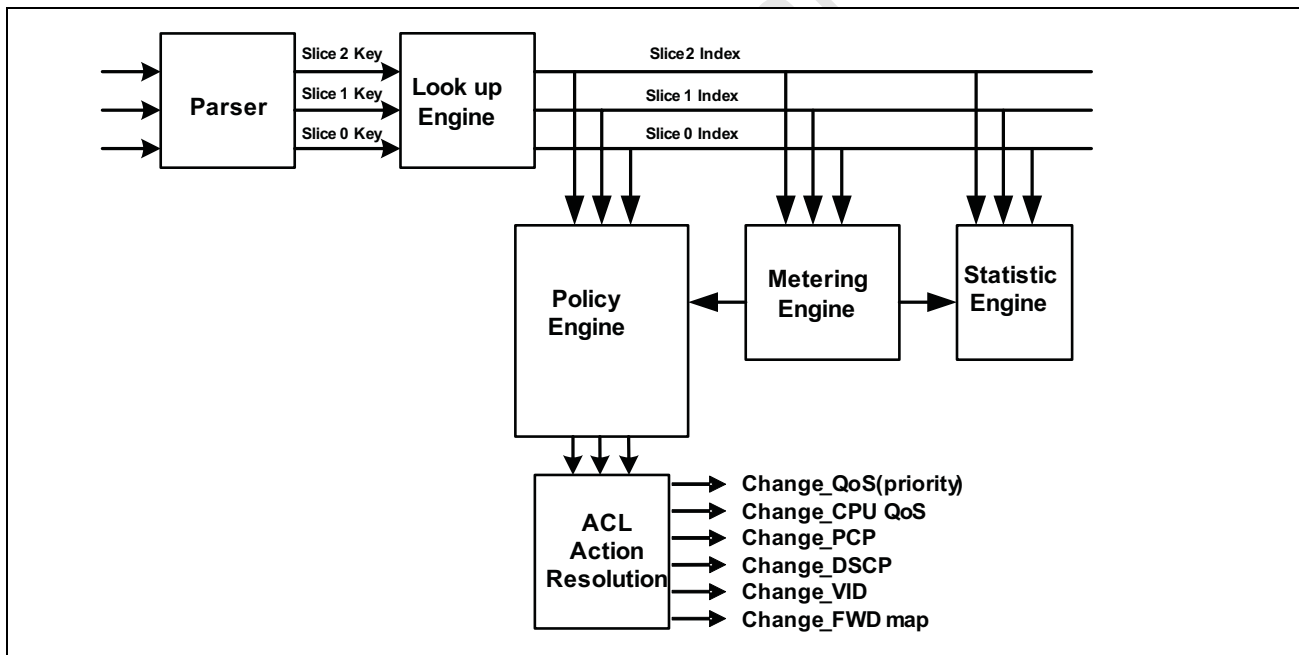

**Figure 15: CFP Engines**

# Parser

The parser parses for standard Ethernet fields, as well as, user-defined fields. Figure 16 shows standard packet format. The parser recognizes the following predefined fields:

- EtherType (ETYPE, 16 bits)

- L2 Known Field
  - Destination MAC address (MAC_DA, 48 bits)
  - Source MAC address (MAC_SA, 48 bits)
  - Outer (Service Provider) Tag (TPID 1, 16 bits)
  - Inner (Customer) Tag (TPID2, 16 bits)
- L3 Known Field (IPv4)
  - Destination IP address (IP_DA, 32 bits)
  - Source IP address (IP_SA, 32 bits)
  - DSCP field (DSCP [6 bits] and CU [2 bits])
  - IP protocol field (IP_PROTOCOL, 8 bits)
  - TTL Range (2 bits)
  - Same IP address (Same_IPAddr, 1 bit)
- L3 Known Field (IPv6)
  - Flow ID (FlowID, 20 bits)
  - Source IP address (IP_SA, 32 bits)
  - Traffic Class (8 bits)
  - Next Header (8 bits)
  - Hop Limit Range (HopLimit_Range, 2bits)
  - Same IP address (Same_IPAddr, 1 bit)
- L4 Known Field (TCP/UDP)
  - Destination Port (DST_port, 16 bits)
  - Source Port (SRC_Port, 16 bits)
  - TCP flags (TCP_FLAG, 6 bits)
    SYN, FIN, ACK, FRAG, RST, PSH
  - Same L4 Port (Same_L4Port, 1 bit)
  - L4 Source less than 1024 (L4SRC_Less1024, 1 bit)
  - TCP Sequence number zero (TCP_Seq_Zero, 1 bit)
  - The length of TCP Header is less than min (MIN_TCP_Header, 1 bit)
- L4 Known Fields (ICMP/IGMP)
  - Type (8 bits)
  - Code (8 bits)
  - Max_ICMP (1 bit)
- Range Field
  - BCM53242M supports eight ranger mechanism: four rangers are used to detect the range of C-VID of received packets, and four rangers are used to detect the rage of TCP/UDP port of received packets. All rangers are globally configurable in terms of range setting and DST/SRC checking.
  - C_VLAN Range (4 bits): Each bit indicates whether the C_VID of the received packet falls into the corresponding range.
  - L4_Port Range (4 bits): Each bit indicates whether the L4 (DST/SRC) port of the received TCP/UDP packet falls into the corresponding range.

- User-Defined Field
    - User-define field A0 ... A2 (UDF A, 16-bits wide) used for slice 0
    - User-define field B0 ... B10 (UDF B, 16-bits wide) used for slice 1
    - User-define field C0 ... C2 (UDF C, 16-bits wide) used for slice 2
    - User-define field D0 ... D7 (UDF D, 32-bits wide) used for slice 2
    - The four Offset parameters are used to define the location of particular UDF field within the packet. They are defined in the UDF definition registers.

# Lookup Engine

The lookup engine is a highly flexible TCAM. This table contains fully user-programmable entries. Each entry has its individual corresponding mask. CFP implements three fixed rule templates, which are called Slice 0, Slice 1 and Slice 2. Table 4 on page 70, Table 5 on page 70, Table 6 on page 72, and Table 7 on page 72 show the slice key field description.

*Table 4:  Slice Key Common Fields*

| Field | Width (bits) | Bit Position | Description |
|---|---|---|---|
| Slice ID | 2 | 1:0 | Indicates the search slice number |
| Ingress Port Map | 29 | 30:2 | Indicates which ingress port(s) the associated ACL rule will apply |
| SP Tagged | 1 | 31 | Indicates whether the received packet is Service Provider tagged. |
| C Tagged | 1 | 32 | Indicates whether the received packet is Customer tagged. |
| L2 Format | 2 | 34:33 | Indicates L2 encapsulation of the received packets:<br>• 00: L2_Others<br>• 01: Ethernet_II<br>• 10: IEEE_802_2_SNAP |
| L3 Format | 2 | 36:35 | Indicates L3 encapsulation of the received packets:<br>• 00: L3_Others<br>• 01: IPV4 without fragmentation<br>• 10: IPV6 without extension |
| L4 Format | 2 | 38:37 | Indicates L4 encapsulation of the received packets:<br>• 00: L4_Others. Including IPV4 with fragmentation and IPV6 with extension fields.<br>• 01: TCP<br>• 10: UDP<br>• 11: ICMP/IGMP |
| Range Field | 8 | 42:39 | VLAN range |
|  |  | 46:43 | L4 src/dst port range |

*Table 5:  Slice 0 Key Field Definition*

| Field | Width (bits) | Bit Position[a] | Description |
|---|---|---|---|
| Slice Common Field | 47 | 46:0 | Shown in Slice Common Field table (see Table 4) |
| L2 Known Field | 128 | 94:47 | Destination MAC address (MAC_DA, 48 bits) |
|  |  | 142:95 | Source MAC address (MAC_SA, 48 bits) |
|  |  | 158:143 | Outer (Service Provider) Tag (TPID 1, 16 bits) |
|  |  | 174:159 | Inner (Customer) Tag (TPID2, 16 bits) |

a.   All undefined bit positions are reserved.

# Policy Engine

Table 4 on page 70, Table 5 on page 70, Table 6 on page 72, and Table 7 on page 72 contain one entry per lookup engine entry and the actions/policies that should be taken for the lookup engine entry. The policy entry also indicates which metering and counter entries should be used.

There are six types of actions in CFP policy.

1.  The forwarding-related action. Change the destination port or add destination port. It can also drop a frame by making new_dest to 6'b11_1111 and enable change destination.

2.  To change the priority of the frame. The priority queue can be specified to use by setting PRI_MAP accordingly.

3.  To change the QoS of the outgoing packets.

4.  To change the QoS of the CPU originated packets.

5.  To change the DSCP tag of the outgoing packets.

6.  To change the VID of the outgoing packets.

All six operations can be asserted in parallel, so it is possible that in the end of ContentAware processing, assign to a specific priority and also copy to CPU port and update the corresponding counter.

## Packet Remarking

BCM53242M supports Packet Remarking. Remarks can be made on the PCP field of the outmost VLAN tag of the outgoing packet, or remarks can be made on the DSCP field if the outgoing packet is an IP packet. The remarking process is a part of the ChangePCP, and the ChangeDSCP actions from the CFP, and carried over through the MMU as a part of the packet descriptor information. Based on the new DSCP value, the corresponding IP checksum is also re calculated. The Remarking information is applied globally, independent to the Egress port.

## VID Replacement

BCM53242M supports VID Replacement. The VID field of the outmost VLAN tag of the outgoing packet can be replaced. The Replacement feature is port dependent, each port can be setup differently. Each Egress port supports a 16 entry FLOW to VID mapping table which is indexed by the FlowID. This is derived as a part of the ChangeVID action from the CFP, and is carried through the MMU as a part of the packet descriptor information.

One of the applications for this feature is in the IPTV distribution where the common Multicast VLAN can be dynamically associated with different subscriber's VLANs.

## Metering Engine

Metering engine provides the ability to control ingress bandwidth based on packet classification. Metering determines whether a packet is inband or outband. The results of the metering engine is fed back to the policy engine for determining which actions should be processed.

## Statistic Engine

The Statistics engine increments the counters based on the metering results. For each rule, there are in-profile and out-profile counters counting packets (not bytes).

## ACL Action Resolution Block

The Action Resolution engine collects the information (action and metering results) from the hit entries: if more than one rule matches, the actions and meter/counters are taken from the policy associated with the matched rule with highest priority.

# Section 3: System Functional Blocks

## Overview

The BCM53242M includes the following functional blocks:

- "Media Access Controller"
- "Integrated PHY" on page 77
- "Frame Management" on page 88
- "Switch Controller" on page 93
- "Integrated High-Performance Memory" on page 94
- "Clocking" on page 94
- "MIB Engine" on page 94

Each are discussed in more detail in the following sections.

## Media Access Controller

The MAC automatically selects the appropriate speed, CSMA/CD or Full-duplex, based on the PHY auto-negotiation result. In FDX mode, 802.3x PAUSE-frame-based flow control is also determined through auto-negotiation. The MAC is IEEE 802.3, 802.3u, and 802.3x compliant.

### Receive Function

The MAC initiates frame reception following the assertion of receive data valid indication from the physical layer. The MAC monitors the frame for the following error conditions:

- Receive error indication from the PHY
- Runt frame error if frame is fewer than 64 bytes
- CRC error
- Long frame error if frame is greater than 2048 bytes (Rev. A silicon)
- For revision B silicon, long frame error if frame is greater than MAX_RX_LIMIT, which is defined in "New Control Register (Page 00h/Addr 03h)" on page 157.

If no errors are detected, the frame is processed by the switch controller. Frames with errors are discarded. Receive functions can be disabled.

# Transmit Function

Frame transmission begins with the switch controller queuing a frame to the MAC transmitter. The frame data is transmitted as received from the switch controller. The transmit controller is responsible for preamble insertion, carrier deferral, collision backoff, and inter-packet gap enforcement.

In 10/100 half-duplex mode, when a frame is queued for transmission, the transmit controller behaves as specified by the 802.3 requirements for frame deferral. Following deferral, the transmitter adds 8 bytes of preamble and SFD to the frame data received from the switch controller. If, during frame transmission, a collision is observed and the collision window timer has not expired, the transmit controller asserts jam and then executes the backoff algorithm. The frame is retransmitted when appropriate. On the sixteenth consecutive collision, the backoff algorithm starts over at the initial state, the collision counter is reset and attempts to transmit the current frame continue. Following a late collision, the frame is aborted and the switch controller is allowed to queue the next frame for transmission.

While in full-duplex mode, the transmit controller ignores carrier activity and collision indication. Transmission begins after the switch controller queues the frame and the 96 bit-times of IPG have been observed. Transmit functions can be disabled.

# Flow Control

The BCM53242M implements an intelligent flow control algorithm to minimize the system impact resulting from traffic congestion. Buffer memory allocation is adaptive to the status of each port's speed and Duplex mode, providing an optimal balance between flow management and per-port memory depth. The BCM53242M initiates flow control in response to buffer memory conditions on a per-port basis.

The MACs are capable of flow control in both full-and half-duplex modes.

## 10/100 Mbps Half-Duplex

In 10/100 Half-duplex mode, the MAC backpressures a receiving port by transmitting a 96-bit time-jam packet to the port. A single jam packet is asserted for each received packet for the duration of the time the port is in the flow control state.

## 10/100/1000 Mbps Full-Duplex

Flow control in full-duplex mode functions as specified by the IEEE 802.3x requirements. In the receiver, MAC flow control frames are recognized and, when properly received, set the flow control pause time for the transmit controller. The pause time is assigned from the 2-byte pause time field following the pause opcode. MAC control PAUSE frames are not forwarded from the receiver to the switch controller.

When the switch controller requests flow control, the transmit controller transmits a MAC control PAUSE frame with the pause time set to maximum. When the condition that caused the flow control state is no longer present, a second MAC control PAUSE frame is sent with the pause time field set to 0.

The flow control capabilities of the BCM53242M are enabled based on the results of auto-negotiation and the state of the ENFDXFLOW and ENHDXFLOW control signals loaded during reset. Flow control in half-duplex mode is independent of the state of the link partner's flow control (802.3x) capability. See Table 8 for more information.

*Table 8:  Flow Control Modes*

| Link Partner Flow Control (802.3x) | Control Input ENFDXFLOW | Control Input ENHDXFLOW | Auto-Negotiated Link Speed | Flow Control Mode |
|---|---|---|---|---|
| X | X | 0 | Half-Duplex | Disabled |
| X | X | 1 | Half-Duplex | Jam Pattern |
| 0 | 0 | X | Full-Duplex | Disabled |
| 0 | 1 | X | Full-Duplex | Disabled |
| 1 | 0 | X | Full-Duplex | Disabled |
| 1 | 1 | X | Full-Duplex | IEEE 802.3x Flow Control |

# Integrated PHY

The PHY is the ethernet transceiver that appropriately processes data presented by the MAC into an analog data stream to be transmitted at the MDI interface, and performs the reverse process on data received at the MDI interface. The registers of the PHY are read/written to via the programming interface. The following sections describe the operations of the internal PHY block.

**Note:** The 24 integrated transceivers are referred to in this document as ports 24, 25 … and 47. Broadcom SDK maps these ports to logical ports 0, 1 … 23 respectively.

## Encoder

In 10Base-T mode, Manchester encoding is performed on the data stream that is transmitted on the twisted-pair cable. The multimode transmit digital-to-analog converter (DAC) performs pre-equalization for 100m of Category-3 cabling.

In 100Base-TX mode, the PHY transmits a continuous data stream over the twisted-pair cable. The transmit packet is encapsulated by replacing the first 2 nibbles of preamble with a start-of-stream delimiter (/J/K/ codes) and appending an end-of-stream delimiter (/T/R/ codes) to the end of the packet. The transmitter repeatedly sends the idle (/i/ code) between packets. The encoded data stream is serialized and then scrambled by the stream cipher block. The scrambled data is then encoded into MLT3 signal levels.

## Decoder

In 10Base-T mode, Manchester decoding is performed on the data stream.

In 100Base-TX mode, following equalization and clock recovery, the receive data stream is converted from MLT3 to serial nonreturn to zero (NRZ) data. The NRZ data is descrambled by the stream cipher block, as described later in this document. The descrambled data is then deserialized and aligned into 5-bit code groups. The 5-bit code groups are decoded into 4-bit data nibbles. The start-of-stream delimiter is replaced with preamble nibbles, and the end-of-stream delimiter and idle codes are replaced with 0h. The decoded data is driven onto the internal MAC interface. When an invalid code group is detected in the data stream, the PHY asserts the internal MII receive error signal. This signal is also asserted when the link fails or when the descrambler loses lock during packet reception.

## Link Monitor

In 10Base-T mode, a link-pulse detection circuit constantly monitors the TRD± pins for the presence of valid link pulses.

In 100Base-TX mode, receive signal energy is detected by monitoring the receive pair for transitions in the signal level. Signal levels are qualified using squelch detect circuits. When no signal is detected on the receive pair, the link monitor enters the Link Fail state and the transmission and reception of data packets is disabled. When a valid signal is detected on the receive pair for a minimum of 1 ms, the link monitor enters link-pass state and the transmit and receive functions are enabled.

## Digital Adaptive Equalizer

The digital adaptive equalizer removes intersymbol interference (ISI) created by the transmission channel media. The equalizer accepts sampled unequalized data from the analog-to-digital converter (ADC) on each channel and produces equalized data. The PHY achieves optimum signal-to-noise ratio by using a combination of feed forward equalization (FFE) and decision feedback equalization (DFE) techniques. Under harsh noise environments, these powerful techniques achieve a bit error rate (BER) of less than $1 \times 10^{-12}$ for transmissions up to 100m on Category-5 twisted-pair cabling (100m on Category-3 UTP cable for 10Base-T mode). The all-digital nature of the design drives high noise-tolerant performance. The filter coefficients are self-adapting to accommodate varying conditions of cable quality and cable length.

## Analog-to-Digital Converter

Each receive channel has its own 125-MHz analog-to-digital converter (ADC) that samples the incoming data and feeds the output to the digital adaptive equalizer. Advanced analog circuit techniques achieve the following results:

- Low offset
- High power-supply noise-rejection
- Fast settling time
- Low bit-error-rate

## Clock Recovery/Generator

The clock recovery and generator block creates the transmit and receive clocks for 100Base-TX and 10Base-T operation.

In 10Base-T or 100Base-TX mode, the transmit clock is locked to the 25-MHz crystal input, and the receive clock is locked to the incoming data stream.

# Baseline Wander Correction

100Base-TX data streams are not always DC-balanced. Because the receive signal must pass through a transformer, the DC offset of the differential receive input can vary with data content. This effect, which is known as baseline wander, can greatly reduce the noise immunity of the receiver. The PHY automatically compensates for baseline wander by removing the DC offset from the input signal, thereby significantly reducing the probability of a receive symbol error.

In 10Base-T mode, baseline wander correction is not performed because the Manchester coding provides perfect DC balance.

# Multimode TX Digital-to-Analog Converter

The multimode transmit digital-to-analog converter (DAC) transmits PAM5, MLT3, and Manchester coded symbols. The transmit DAC performs signal wave shaping that decreases the unwanted high-frequency signal components, reducing electromagnetic interference (EMI). The transmit DAC uses a current drive output that is well-balanced, and therefore, produces very low noise transmit signals.

# Stream Cipher

In 100Base-TX mode, the transmit data stream is scrambled to reduce radiated emissions and to ensure that there are adequate transitions within the data stream. The scrambler reduces peak emissions by randomly spreading the signal energy over the transmit frequency range and eliminating peaks at certain frequencies. The randomization of the data stream also assists the digital adaptive equalizers and echo/crosstalk cancelers. The algorithms in these circuits require there to be no sequential or cross-channel correlation among symbols in the various data streams.

In 100Base-TX mode, the transmit data stream is scrambled by exclusive ORing the encoded serial data stream. This is done with the output of an 11-bit wide linear feedback shift register (LFSR), producing a 2047-bit nonrepeating sequence.

The receiver descrambles the incoming data stream by exclusive ORing it with the same sequence generated at the transmitter. The descrambler detects the state of the transmit LFSR by looking for a sequence representing consecutive idle code groups. The descrambler locks to the scrambler state after detecting a sufficient number of consecutive idle codes. The BCM53242M enables transmission and reception of packet data only when the descrambler is locked. The receiver continually monitors the input data stream to ensure that it has not lost synchronization by checking that inter-packet gaps containing idles or frame extensions are received at expected intervals.

In 10Base-T mode, scrambling is not required to reduce radiated emissions.

# Wire Map and Pair Skew Correction

During 10/100-Mbps operation, pair swaps are corrected. Delay skew is not an issue though, because only one pair of wires is used in each direction.

# Internal Loopback Mode

When enabled in this mode, all packets egressed to the integrated PHY ports are looped back internally from the TXD signals to the RXD signals. The transmitter outputs TRD± are set to high impedance, and incoming packets on the cable are ignored.

# Isolate Mode

The PHY can be isolated from the internal MAC interface. When the transceiver is put into Isolate mode, all inputs from the MAC block are ignored, and all outputs to the MAC block are tristated. While in Isolate mode, the PHY still sends out link pulses or FLPs, depending on whether the PHY was configured for Forced or Auto-negotiation mode. A link is established if the link partner is forced or is advertising the same technologies. Clearing the same bit removes the device from Isolate mode.

# PHY Registers

Each transceiver within the BCM53242M contains a complete set of PHY registers. The 5-bit transceiver address is assigned correspondingly to the internal port ID. All PHY registers can be accessed through the MDC and MDIO signals, or through the Serial Peripheral Interface.

# 100Base-FX Fiber Mode

The 10/100 port can be configured to operate in 100Base-FX compatible mode. The following sequence is required for configuring the preferred PHY ports to 100Base-FX-compatible operation using register write from the CPU. Each port's register can be programmed through page A0h-B7h, respectively.

1. Write 2100h to register (Pages A0h-B7h, Address 00h-01h). This forces the port to 100M full-duplex without auto-negotiation. Most FX applications require configuration for full-duplex.

2. Set bits 9 and 5 of register (Pages A0h-B7h, Address 20h-21h). This bypasses the scrambler and descrambler blocks (i.e., these scrambling functions are not required for 100Base-FX operation). Other bits within this register may be set, so it is best to perform a read-modified write to ensure proper setting of this register.

3. Set bit 5 of hidden register (Page A0h-B7h, Address 2Eh–2Fh). This changes the three-level MLT-3 code transmitted by the PHY to two-level binary, suitable for driving standard fiber transceivers. Additionally, the PHY receiver is configured to recognize binary signaling. This register access must also be in the form of a read-modified write.

4. Enable Internal EFX Signal Detect Function:
   a. Write 008Bh to register (Pages A0h-B7h, Address 3Eh–3Fh).
   b. Write 0200h to register (Pages A0h-B7h, Address 32h–33h).
   c. Write 0084h to register (Pages A0h-B7h, Address 3Ah–3Bh).

d.  Write 000Bh to register (Pages A0h-B7h, Address 3Eh–3Fh).

5.  Configure Full-duplex Pause Capability by setting bit 63 and relevant port bits[47:24] of the Software Flow Control registers (Page 00H, Address 48h).

Refer to the *Enhanced-FX-AN1XX 100Base-FX-Compatibility Application Note* for the FX termination requirement.

# Cable Analyzer Registers and Programming

Cable diagnostics can be initiated at any time by entering certain parameters in the required register bits and then setting the *start* bit. Once the start bit is set, the PHY starts the cable diagnostics and looks for opens, shorts, cable lengths on pair-A and pair-B. When this analysis is completed, it records the results and resets the start bit.

## Shadow Register Description

All of the required bits for the cable analyzer are located in the shadow registers, in particular shadow registers (Pages A0h-B7h, addresses 26h and 28h). Within address 26h, there are eight subregisters 0x26-0, 0x26-1, 0x26-2, 0x26-3, 0x26-4, 0x26-5, 0x26-6, and 0x26-7.

Shadow register 0x26-n is accessed by writing an index value (n = 000b to 111b) to the shadow register at address 28h. To access shadow register 0x26-1, the index value in shadow register 28h must be set to 1. Whenever an access is made (either a read or a write) to shadow register 26h, the index value in the shadow register 28h is automatically incremented.

When changing a bit within any register, preserve the existing values of reserved bits by performing a 'read modify' write.

The following tables shows the cable analyzer registers and their contents.

*Table 9:  Shadow Register 28h (Pages A0h-B7h, Address 28h)*

| Address | 15–11 | 10–8 | 7–0 | Default |
|---------|-------|------|-----|---------|
| 0x28 | Reserved | 0x26 index | Reserved | 0x0000 |

## 0x26 Index [10:8]

To access shadow register 26h, first an index value from 0(000b) to 7(111b) must be written to these bits. When an access (either read or write) is made to shadow register 26h, this value automatically increments by 1 (111b after the increment, it becomes 000b).

*Table 10:  Shadow Register 0x26–0 (Pages A0h-B7h, Address 26h)*

| Address | 15–14 | 13–12 | 11–10 | 9–8 | 7–6 | 9–3 | 2 | 1 | 0 | Default |
|---------|-------|-------|-------|-----|-----|-----|---|---|---|---------|
| 0x26-0 | Reserved | Pair-B State | Pair-A State | Pass | Error | Reserved | Start | MP | Reserved | 0x0000 |

## Pair-B State[13:12]

After the completion of cable analyzer, these bits indicate the status of pair-B of the cable (see Table 11 for details). Pair-B of the cable is the pair that is connected to RD± of the device.

*Table 11:  Pair-B State*

| Value | Result for Pair-B |
|-------|-------------------|
| 00b | No fault detected |
| 01b | Pair is open |
| 10b | Pair is short |
| 11b | Reserved |

**Note:** When the cable analyzer function returns a value of 00 (No fault detected), then the attached cable is good. If the device is unable to establish a valid link, the problem is not related to the cable.

## Pair-A State[11:10]

After the completion of cable analyzer, these bits indicate the status of pair-A of the cable (see Table 12 for details). Pair-A of the cable is the pair that is connected to TD± of the device.

*Table 12:  Pair-A State*

| Value | Result for Pair-A |
|-------|-------------------|
| 00b | No fault detected |
| 01b | Pair is open |
| 10b | Pair is short |
| 11b | Reserved |

**Note:** When the cable analyzer function returns a value of 00 (No fault detected), then the attached cable is good. If the device is unable to establish a valid link, the problem is not related to the cable.

## Start [2]

Setting this bit to a 1 starts the cable diagnostics function in the BCM5325EBCM5325F. This should be the last bit that is set after programming the required values in shadow registers 0x26-0, 0x26-1, 0x26-2, 0x26-3, 0x26-4, 0x26-5, 0x26-6 and 0x26-7. This bit is cleared when the cable analyzer function is complete. Once this bit is set, it is reset in approximately 5 ms.

## MP [1] = 1

This is an internal variable required to be set before starting the cable analyzer. Set this bit to a 1.

## Pass [9:8]

These bits are 11b when reading the results of the cable analyzer.

## Error [7:6]

These bits must be 00b when reading the results of the cable analyzer.

**Table 13:  Shadow Register 0x26-1 (Pages A0h-B7h, Address 26h)**

| Address | 15–8 | 7–0 | Default |
|---------|------|-----|---------|
| 0x26-1 | Pair-B length | Pair-A length | 0x0000 |

## Pair-B Length [15:8]

These bits indicate the length of pair-Bonce the cable analyzer is completed. To convert this value to meters, multiply the value by 0.8. This value should be used in combination with the result posted on the condition of pair-B in bits [13:12] of shadow register 0x26-0.

**Table 14:  Pair-B Cable Diagnostics Result**

| Pair-B state [13:12] (shadow register 0x26-0) | Pair-B length [15:8] (shadow register 0x26-1) |
|-----------------------------------------------|------------------------------------------------|
| 01b | Distance at which an open is detected in pair-B |
| 10b | Distance at which a short is detected in pair-B |

## Pair-A Length [7:0]

These bits indicate the length of pair-A once the cable analyzer is completed. To obtain the value in meters, multiply this value by 0.8. This value should be used in combination with the result posted on the condition of pair-A in bits [11:10] of shadow register 0x26-0.

**Table 15:  Pair-A Cable Diagnostics Result**

| Pair-A state [11:10] (shadow register 0x26-0) | Pair-A length [7:0] (shadow register 0x26-1) |
|-----------------------------------------------|------------------------------------------------|
| 01b | Distance at which an open is detected in pair-A |
| 10b | Distance at which a short is detected in pair-A |

**Table 16:  Shadow Register 0x26-2 (Pages A0h-B7h, Address 26h)**

| Address | 15–14 | 13–12 | 11–10 | 9–6 | 5 | 4–0 | Default |
|---------|-------|-------|-------|-----|---|-----|---------|
| 0x26–2 | GainA | Reserved | TypeA | Reserved | HP | ThresholdA | 0x0000 |

## GainA [15:14] = 01b

This is an internal variable required to be set before starting the cable analyzer. Set these bits to 01b.

## TypeA [11:10] = 10b

This is an internal variable required to be set before starting the cable analyzer. Set these bits to 10b.

## HP [5] = 1

This is an internal variable required to be set before starting the cable analyzer. Set these bits to a 1.

## ThresholdA [4:0] = 00100b

This is an internal variable required to be set before setting the start bit in shadow register 0x26-0 to start the cable analyzer. Set these bits to 00100b.

*Table 17:  Shadow Register 0x26-3 (Pages A0h-B7h, Address 26h)*

| Address | 15–8 | 7–0 | Default |
|---------|------|-----|---------|
| 0x26-3 | SourceA | Reserved | 0x0000 |

## SourceA [13:8] = 00100000b

This is an internal variable required to be set before setting the start bit in shadow register 0x26-0 to start the cable analyzer. Set these bits to 00100000b.

*Table 18:  Shadow Register 0x26-4 S (Pages A0h-B7h, Address 26h)*

| Address | 15–11 | 10 | 9 | 8–6 | 5–0 | Default |
|---------|-------|-----|-----|-----|-----|---------|
| 0x26-4 | Reserved | TypeB | Reserved | TPG | Reserved | 0x0000 |

## TypeB [10]

This is an internal variable required to be set before starting the cable analyzer. Set this bit to a 1.

## TPG [8:6]

This is an internal variable required to be set before starting the cable analyzer. Set this bit to 100b.

*Table 19:  Shadow Register 0x26-5 (Pages A0h-B7h, Address 26h)*

| Address | 15–14 | 13–5 | 4–2 | 1–0 | Default |
|---------|-------|------|-----|-----|---------|
| 0x26-5 | GainB | Reserved | ThresholdB | Reserved | 0x0400 |

## GainB [15:14 = 11b]

This is an internal variable required to be set before starting the cable analyzer. Set these bits to 11b.

## ThresholdB [4:2] = 001b

This is an internal variable required to be set before setting the start bit in shadow register 0x26-0 to start the cable analyzer. Set these bits to 001b.

*Table 20:  Shadow Register 0x26-6 (Pages A0h-B7h, Address 26h)*

## SourceB [13:8] = 000001b

This is an internal variable required to be set before setting the start bit in shadow register 0x26-0 to start the cable analyzer. Set these bits to 000001b.

*Table 21:  Shadow Register 0x26-7 (Pages A0h-B7h, Address 26h)*

| Address | 15–9 | 8–6 | 5 | 4–0 | Default |
|---------|------|-----|---|-----|---------|
| 0x26-7 | Reserved | PGWB | Reserved | AmpB | 0x0000 |

## PGWB [8:6] = 001b

This is an internal variable required to be set before setting the start bit in shadow register 0x26-0 to start the cable analyzer. Set this bit to a 001b

## AmpB [4:0] = 01100b

This is an internal variable required to be set before setting the start bit in shadow register 0x26-0 to start the cable analyzer. Set this bit to a 01100b.

## Programming Example

The following example of code shows a general flow of completing the cable analyzer in the PHY.

```
Cable Analyzer programming
--------------------------------------------------
Start
Write register (Pages A0h-B7h, address 3Eh) = 0x008BEnable shadow register
Wait1
Read (Pages A0h-B7h, address 28h) ; Wait here for at least 2 seconds of bit 6 for address 28h to be
at 0. This ensures that there is no energy from the link partner.
Write (Pages A0h-B7h, address 28h) -0x0000
End Wait1
Write register (Pages A0h-B7h, address 26h) = 0x0000
Write register (Pages A0h-B7h, address 28h) = 0x0200;Set access shadow register 26h to 0x26-2
Write (Pages A0h-B7h, address 26h) = 0x4824; 0x26-2
Write (Pages A0h-B7h, address 26h) = 0x4000; 0x26-3
Write (Pages A0h-B7h, address 26h) = 0x0500; 0x26-4
Write (Pages A0h-B7h, address 26h) = 0xC404; 0x26-5
Write (Pages A0h-B7h, address 26h) = 0x0100; 0x26-6
Write (Pages A0h-B7h, address 26h) = 0x004C; 0x26-7
Write (Pages A0h-B7h, address 26h) = 0x8006; 0x26-0 (Start cable diagnostics)
Wait2
    Write (Pages A0h-B7h, address 28h) = 0x0000; Set access to 0x26-0
    Read (Pages A0h-B7h, 1 address 26h) ; Read 0x26-0
    If register 0x26-0 bit [2] = 1 then go to Wait2
Result
Pair-A status = 0x26-0 bit [11:10]
Pair-B status = 0x26-0 bit [13:12]

Read (Pages A0h-B7h, 19h, address 26h) ; Read 0x26-1
Pair-A length = bit [7:0] X 0.8 meters
Pair-B length = bit [15:8] X 0.8 meters

Write register (Pages A0h-B7h, 1address 3Eh) = 0x000BEnable default MII register access
End
```

> **Note:** If a port is connected to a link partner with a good cable (no short or no open on either pair) and the link partner is not powered up, then the cable status bits are valid, but the length bits are invalid.

# Cable Analyzer Flow Chart

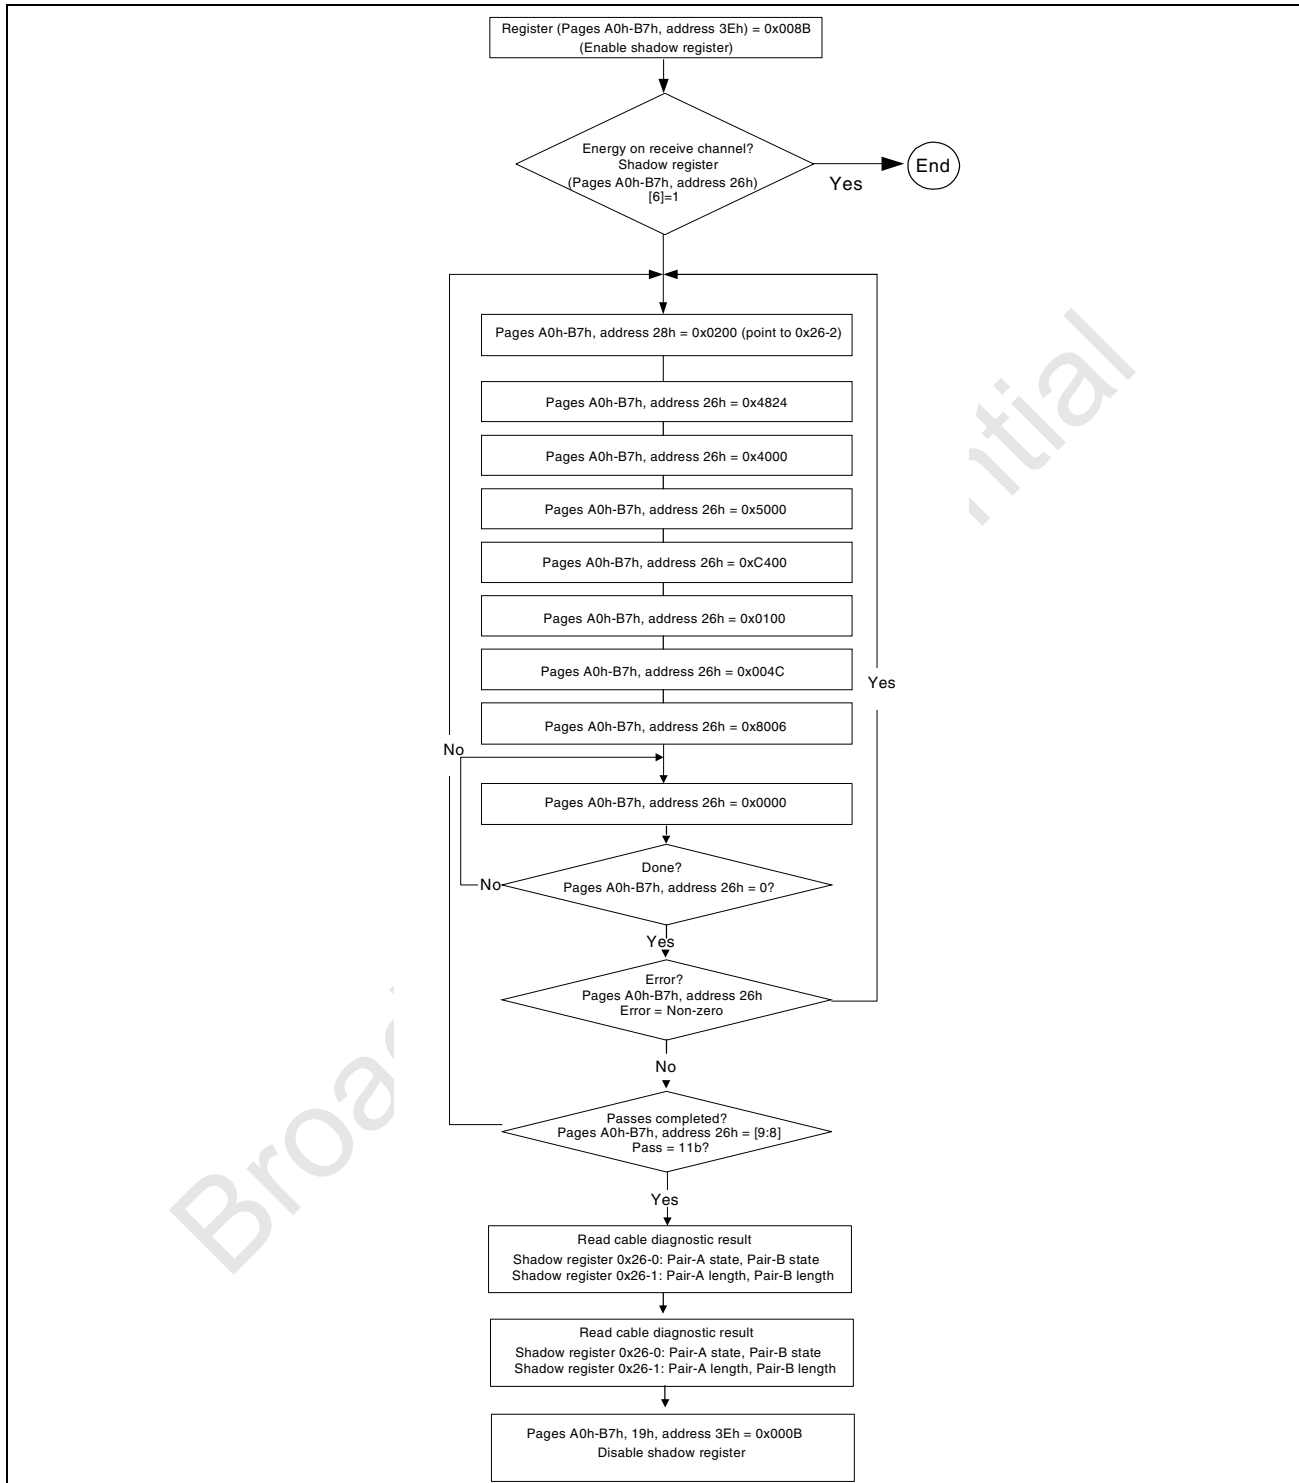

**Figure 17:  Cable Analyzer Flow Chart**

# Frame Management

The BCM53242M provides a frame management block that works in conjunction with a selectable port interface to receive forwarded management frames directed to the switch.

The frame management block is configured via the FRM_MNGT_PORT bits of the Global Management Configuration register as shown in Table 98: "Global Management Configuration Register (Page 03h: Address 00h)," on page 195.

An external CPU connects via the selected port interface to process the forwarded frames and respond appropriately. When the selected port is defined as the Frame Management Port, it is referred to as the In-band Management Port (IMP).

## In Band Management Port

The IMP can be used as a full-duplex port, which can be used to forward management information to the external management agent, such as BPDUs, mirrored frames, or frames addressed to other Static address entries that have been identified as of special interest to the management system.

As IMP is defined as the Frame Management Port, normal frame data is forwarded to the port based on the state of the RX_UCST_EN, RX_MCST_EN and RX_BCST_EN bits in the associated IMP Port Control Register. If these bits are cleared, no frame data will be forwarded to the Frame Management Port, with the exception that frames meeting the Mirror Ingress/Egress Rules criteria, will always be forwarded to the designated Frame Management Port.

The BCM53242M device intrusively tags frames destined to the management entity to allow the identity of the originating ingress port of a frame to be retained. Additional header information is inserted into the original frame, between the original SA field and Type/Length fields, see Figure 18 on page 89. The tag includes the BRCM Type field and the BRCM Tag field. The Broadcom tag type is 0x8874, the alignment of the regenerated FCS may vary depending on the original frame length, and the regenerated FCS covers from the whole frame, including the BRCM Type and BRCM tag. A recalculated FCS is appended to the resultant frame, before the frame is forwarded.

47

0

| Original MAC DA  [ 47:0] | |
| --- | --- |
| Original MAC SA  [ 47:0] | |
| BRCM type | BRCM  tag |
| Original type | |
| Original Frame Data (including original FCS) | |
| | Regenerated FCS |
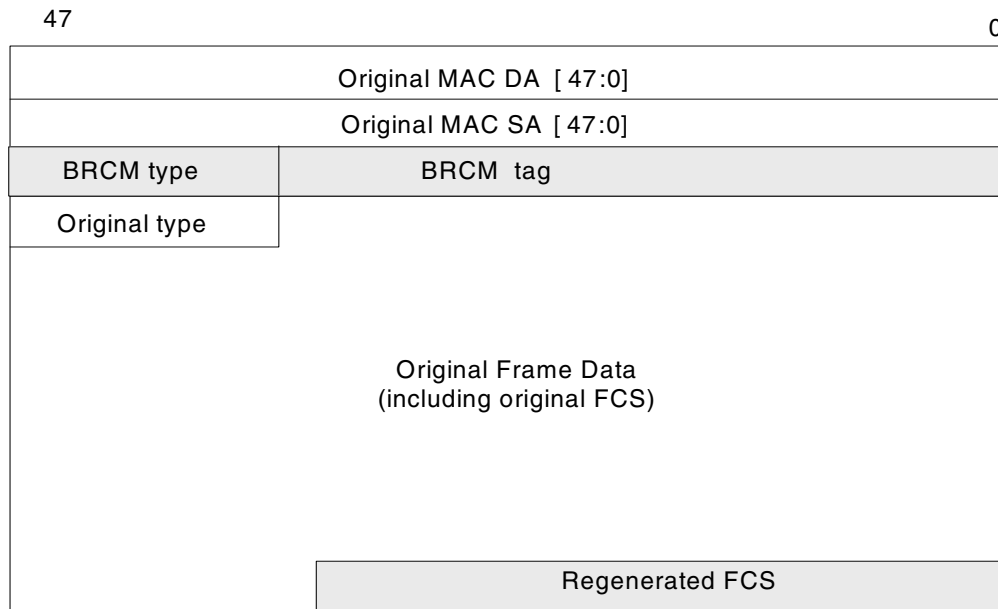

**Figure 18:  Broadcom-Tagged Packet Encapsulation Format**

The Broadcom Tag is designed for asymmetric operation across the IMP port. The information carried from the BCM53242M to the external CPU (IMP Egress) is different from the information carried from the external CPU to BCM53242M (IMP Ingress).

Similarly, the host system must insert the BRCM Type/Length and Tag fields into frames it wishes to send into the management port, to be routed to specific egress ports. The OPCODE within the Tag field determines how the frame will be handled, and allows frames to be forwarded using the normal address lookup or via a Port ID designation within the Tag.

**Note:** The FCS (outer) is ignored by the BCM53242M device. However, the management entity is still intended to provide 4 bytes of any data as a place holder. Only the final outgoing FCS (inner) is required.

The BRCM Tag and BRCM Type/Length fields are transmitted with the convention of highest significant octet first, followed by next lowest significant octet, etc., and with the least significant bit of each octet transmitted out from the MAC first. So for the BRCM Type/Length field in Table 22 on page 90, the most significant octet would be transmitted first (bits 24:31), with bit 24 being the first bit transmitted.

## IMP Ingress

Table 22 shows the format of the IMP Ingress BRCM Tag field. The OPCODE field slightly modifies the use and validity of some fields in the Tag. Table 23 defines the supported OPCODEs.

*Table 22:  BRCM Header Tag Format (CPU to IMP)*

| 31-29 | 28,27 | 26,25 | 24 - 6 | 5-0 |
|---|---|---|---|---|
| Opcode = (000) Unicast/Multicast/ Broadcast | TQ[1:0] | TE[1:0] | Reserved | Reserved |
| Opcode = (010) Egress Directed | TQ[1:0] | TE[1:0] | Reserved | Dest Portid Indicates the destination Port ID for Egress Directed frames. ***Note:*** Setting Dest Portid = 0x30 allows egress directed frame to loopback to CPU. This is for testing purpose. |
| Opcode = (100) Multicast Egress Directed to 10/100 Ports | TQ[1:0] | TE[1:0] | Dest Port Vector [Port 23~Port 0] Defines the destination Port IDs for Multicast Egress Directed frames. ***Note:*** Bit 24 is not used | |
| Opcode = (101) Multicast Egress Directed to GigaPorts | TQ[1:0] | TE[1:0] | | Dest Port Vector [G1, G0, IMP] Defines the destination GigaPort IDs for Multicast Egress direct frames. ***Note:*** 1. Bits 4 and 5 are not used. 2. For testing purpose, setting bit[0] = 1 allows the CPU to loop back the frame at the IMP port. |

*Table 23:  OPCODE Field in BRCM Tag for Management Port Frame*

| OpCodes | Name | Description |
|---|---|---|
| 0 0 0 | Unicast/Multicast | Normal unicast and multicast frames are forwarded using the address table lookup of the DA contained in the frame. |
| | Broadcast | Broadcast frames sent by the host management system into IMP port are forwarded based on the broadcast rule that is in effect. |
| 0 1 0 | Egress Directed | An Egress Directed frame is sent by the host management system into the IMP port, and is forwarded to the Egress Port specified in the Destination Port ID fields in the BRCM Tag. |
| 1 0 0 | Multicast Egress Directed | A Multicast Egress Directed frame is sent by the host management system into the IMP port and is forwarded to multiple 10/100 Egress Ports specified in the Dest Port Vector field in Table 22 on page 90. |
| 1 0 1 | Multicast Egress Directed | A multicast Egress Directed frame is sent by the host management system into the IMP port and is forwarded to multiple Egress ports specified in the Dest Port Vector field in Table 22 on page 90. |

*Table 24:  TQ and TE Fields in BRCM Tag for Management Port Frame*

| Field | Name | Description |
|-------|------|-------------|
| TQ[1:0] | Traffic Class Queue | Uses by the host CPU to assign a traffic class queue for forwarding the packet.<br>• 11: Highest queue<br>• 10: 3rd queue<br>• 01: 2nd queue<br>• 00: Lowest queue |
| TE[1:0] | Tag Enforcement | Used by the host CPU to enforce the 802.1Q/1p tagging/untagging encapsulation of the packet at the egress forwarding of the packet.<br>• 11: Reserved<br>• 10: Enforces tagging regardless of the 802.1Q VLAN untag mask<br>• 01: Enforces untagging regardless of the 802.1Q VLAN untag mask<br>• 00: No enforcement. Follows the 802.1Q VLAN untag mask |

## IMP Egress

Table 25 shows the format of the IMP Egress BRCM Tag field. The OPCODE field slightly modifies the use and validity of some fields in the Tag. Table 26 defines the supported OPCODEs.

*Table 25:  BRCM Header Tag Format (IMP to CPU)*

| 31-29 | 28-17 | 16 | 15-14 | 13 - 8 | 7,6 | 5 - 0 |
|-------|-------|-----|-------|--------|-----|-------|
| Opcode = (000)<br>Unicast<br>Multicast/<br>Broadcast | Frame Oct Count[11:0]<br>This 11-bit field incorporates the Octet Count of the entire Ethernet frame octet count starting at the DA field and inclusive of CRC, but not including the BRCM Type, BRCM Tag, and recalculated FCS. | RSVD | QoS:<br>Indicates the traffic class queue used in forwarding the packet to CPU | Reason Code[5:0]:<br>Indicates the reason code for the packet to be forwarded to CPU. | ERMON 7:<br>Extended RMON for Ingress 6:<br>Extended RMON for Egress | SRC_PID:<br>Indicates the source Port ID for ingress directed frames. |

*Table 26:  OPCODE Field in BRCM Tag for Management Port Frame*

| OpCodes | Name | Description |
|---------|------|-------------|
| 0 0 0 | Unicast/<br>Multicast/<br>Broadcast | Unicast, multicast, reserved multicast and broadcast frames from a network port destined to the host management system are forwarded using the address table lookup of the DA contained in the frames. All frames are automatically inserted a BRCM Tag that includes the Frame Oct Count and Source Port ID fields. |

*Table 27:  Reason Code Field in BRCM Tag for Management Port Frame*

| Reason Code | Name | Description |
|---|---|---|
| 0 | Mirroring | The packet is mirrored to the CPU as the capture port. |
| 1 | SA Learning | The packet is forwarded to the CPU for controlled MAC SA learning. |
| 2 | Switching/Flooding | The packet is forwarded to the CPU either because of flooding or the CPU is the intended receive host. |
| 3 | Protocol Termination | The packet is trapped by the CPU because an IEEE 802.1-defined L2 protocol must be terminated by the CPU. |
| 4 | Protocol Snooping | The packet is copied to the CPU because an L3 or application level protocol must be monitored by the CPU for network security or operation efficiency. |
| 5 | Exception Processing/Flooding | The packet is trapped and forwarded to the CPU either because of flooding or for some special processing, even though the CPU is not the intended receive host. |

# Switch Controller

The core of the BCM53242M device is a cost-effective and high-performance switch controller. The controller manages packet forwarding between the MAC receive and transmit ports through the frame buffer memory with a store and forward architecture. The switch controller encompasses the functions of buffer management, memory arbitration and transmit descriptor queueing.

## Buffer Management

The frame buffer memory is divided into 256 bytes per page. Each packet received may allocated more than one page, of which, six pages are required for storing maximum 1536B frame data. Frame data is stored to the memory block as the packet is received. After reception, the frame is queued to the egress port(s) transmit queue. For unicast frames, following transmission of a packet from the frame buffer memory, the block of memory for the frame is released to the free buffer pool. If the frame is destined to multiple ports, the memory block is not released until all ports complete transmission of the frame.

## Memory Arbitration

Processes requesting access to the internal memory include the receive and transmit frame data handlers, address resolution, learning and aging functions, and output port queue managers. These processes are arbitrated to provide fair access to the memory and minimize latency of critical processes to provide a fully nonblocking solution.

## Transmit Output Port Queues

When the Quality of Service (QoS) function is turned off, the switch controller maintains an output port queue for each port. The queue depth becomes smaller for each output port when the QoS function is on. Transmit descriptors are updated after the packet has been received and the destination port resolved. One or two transmit descriptors are assigned to each destination port queue linking the destination with the frame data. For packets which have frame sizes larger than 512 bytes, two transmit descriptors are required. In the case of multicast and broadcast packets, a transmit descriptor for the packet is assigned to the transmit descriptor queues of multiple ports.

For each port, frames are initiated for transmission with minimum IPG until the transmit descriptor queue of the port is empty.

When the QoS is turned on, the single queue is split into four different-sized priority queues. These four queues are maintained by the switch controller for each transmit port. The weighted fair scheduling is applied to the queues to select frames from all queues and prevent starvation.

# Integrated High-Performance Memory

The BCM53242M includes 4 Mb of integrated, high-performance RAM which stores all packet buffer and address table information; and eliminates the need for external memory. This allows for the implementation of extremely low-cost systems.

# Clocking

The BCM53242M uses a single 25-MHz clock input to derive the device's internal clocks to operate at 100 MHz, which affect the operation of the system logic and internal RAM. This allows for the best trade-offs with respect to performance, cost, and power.

# MIB Engine

The MIB Engine is responsible for processing status words received from each port. Based on whether it is a receive status or transmit status, appropriate MIB counters are updated. The BCM53242M implements 70 plus MIB counters on a per-port basis. MIB counters can be categorized into three groups:

- Receive only counters
- Transmit only counters
- Receive or transmit counters

The receive or transmit counters group can, as a group, be selectively steered to the receive or transmit process on a per-port basis. The following section describes each individual counter.

## MIB Counters Per Port

*Table 28:  Receive Only Counters (17)*

| Counters | Description |
|---|---|
| RxDropPkts (32 bit) | The number of packets received by a port that were dropped due to security conflict when MAC address security Control is enabled. |
| RxOctets (64 bit) | The number of bytes of data received by a port (excluding preamble but including FCS), including bad packets. |
| RxBroadcastPkts (32 bit) | The number of good packets received by a port that are directed to the broadcast address. This counter does not include errored broadcast packets or valid multicast packets. |
| RxMulticastPkts (32 bit) | The number of good packets received by a port that are directed to a multicast address. This counter does not include errored multicast packets or valid broadcast packets. |
| RxSAChanges (32 bit) | The number of times the SA of good receive packets has changed from the previous value. A count greater than 1 generally indicates the port is connected to a repeater based network. |

*Table 28:  Receive Only Counters (17) (Cont.)*

| Counters | Description |
|---|---|
| RxUndersizePkts (32 bit) | The number of good packets received by a port that are less than 64 bytes long (excluding framing bits but including the FCS). |
| RxOversizePkts (32 bit) | The number of good packets received by a port that are greater than MAX_RX_LIMIT (excluding framing bits but including the FCS). This counter alone is incremented for packets in the range MAX_RX_LIMIT–2048 bytes inclusive, whereas both this counter and the RxExcessSizeDisc counter is incremented for packets of 2049 bytes and higher. (Revision B silicon.) |
| | See Bit 2:1 at Table 51: "New Control Register (Page 00h: Address 03h)," on page 157. |
| | The number of good packets received by a port that are greater than 1518 (excluding framing bits but including the FCS). This counter alone is incremented for packets in the range 1518–2048 bytes inclusive, whereas both this counter and the RxExcessSizeDisc counter is incremented for packets of 2049 bytes and higher. (Revision A silicon) |
| RxFragments (32 bit) | The number of packets received by a port that are less than 64 bytes (excluding framing bits) and have either an FCS error or an alignment error. |
| RxJabbers (32 bit) | The number of packets received by a port that are longer than MAX_RX_LIMIT bytes and have either an FCS error or an alignment error (Revision B silicon). |
| | See Bit 2:1 at Table 51: "New Control Register (Page 00h: Address 03h)," on page 157. |
| | The number of packets received by a port that are longer than 1522 bytes and have either an FCS error or an alignment error (Revision A silicon). |
| RxUnicastPkts (32 bit) | The number of good packets received by a port that are addressed to a unicast address. |
| RxAlignmentErrors (32 bit) | The number of packets received by a port that have a length (excluding framing bits but including FCS) between 64 and 1522 bytes, inclusive, and have a bad FCS with a nonintegral number of bytes. |
| RxFCSErrors (32 bit) | The number of packets received by a port that have a length (excluding framing bits but including FCS) between 64 and 1522 bytes inclusive, and have a bad FCS with an integral number of bytes. |
| RxGoodOctets (64 bit) | The total number of bytes in all good packets received by a port (excluding framing bits, but including FCS). |
| RxExcessSizeDisc (32 bit) | The number of good packets received by a port that are greater than 2048 bytes (excluding framing bits but including the FCS) and were discarded due to excessive length. |
| RxPausePkts (32 bit) | The number of PAUSE frames received by a port. The PAUSE frame must have a valid MAC Control Frame EtherType field (88-08h), have a destination MAC address of either the MAC Control frame reserved multicast address (01-80-C2-00-00-01) or the unique MAC address associated with the specific port, a valid PAUSE Opcode (00-01), be a minimum of 64 bytes in length (excluding preamble but including FCS), and have a valid CRC. Although an 802.3-compliant MAC is only permitted to transmit PAUSE frames when in full duplex mode, with flow control enabled, and with the transfer of PAUSE frames determined by the result of auto-negotiation, an 802.3-MAC receiver is required to count all received PAUSE frames, regardless of its half/full-duplex status. An indication that a MAC is in half-duplex with the RxPausePkts incrementing indicates a noncompliant transmitting device on the network. |

*Table 28:  Receive Only Counters (17) (Cont.)*

| Counters | Description |
|---|---|
| RxSymbolErrors (32 bit) | The total number of times a valid length packet was received at a port and at least one invalid data symbol was detected. Counter only increment once per carrier event and does not increment on detection of collision during the carrier event. |
| RxDiscPkts (32 bit) | The number of good packets received by a port that are discarded by the forwarding processes. This counter increments each time a good packet received by a port is discarded due to a final egress forwarding decision produced by the following processes:<br>• ARL DA<br>• VLAN<br>• Spanning tree<br>• EAP<br>• CFP<br>• Protected port<br>• WAN port<br>• VPN port<br>• Link down status<br>• Rate control<br>• Flow control<br>This counter does not include packets dropped due to Rx-based flow control process. |

*Table 29:  Transmit Counters Only (21)*

| Counters | Description |
|---|---|
| TxDropPkts (32 bit) | This counter is incremented every time a transmit packet is dropped due to lack of resources (e.g., transmit FIFO underflow), or an internal MAC sublayer transmit error not counted by either the TxLateCollision or the TxExcessiveCollision counters. |
| TxOctets (64 bit) | The total number of good bytes of data transmitted by a port (excluding preamble but including FCS). |
| TxBroadcastPkts (32 bit) | The number of good packets transmitted by a port that are directed to a broadcast address. This counter does not include errored broadcast packets or valid multicast packets. |
| TxMulticastPkts (32 bit) | The number of good packets transmitted by a port that are directed to a multicast address. This counter does not include errored multicast packets or valid broadcast packets. |
| TxCollisions (32 bit) | The number of collisions experienced by a port during packet transmissions. |
| TxUnicastPkts (32 bit) | The number of good packets transmitted by a port that are addressed to a unicast address. |
| TxSingleCollision (32 bit) | The number of packets successfully transmitted by a port that experienced exactly one collision. |
| TxMultipleCollision (32 bit) | The number of packets successfully transmitted by a port that experienced more than one collision. |

*Table 29:  Transmit Counters Only (21)  (Cont.)*

| Counters | Description |
|---|---|
| TxDeferredTransmit (32 bit) | The number of packets transmitted by a port for which the first transmission attempt is delayed because the medium is busy. |
| TxLateCollision (32 bit) | The number of times that a collision is detected later than 512 bit-times into the transmission of a packet. |
| TxExcessiveCollision (32 bit) | The number of packets that are not transmitted from a port because the packet experienced 16 transmission attempts. |
| TxPausePkts (32 bit) | The number of PAUSE frames transmitted by a port. The MAC resolve to full duplex mode, with 802.3x flow control PAUSE frame exchange enabled at the completion of auto-negotiation. |
| TxFrameInDisc (32 bit) | The number of valid packets received which are discarded by the forwarding process due to lack of space on an output queue. Not maintained or reported in the MIB counters. Located in the Congestion Management registers (Page 0Ah). This attribute only increments if a network device is not acting in compliance with a flow control request, or the BCM53242M internal flow control/buffering scheme has been misconfigured. |
| TxQoS0Pkts (32 bit) | The total number of good packets transmitted on queue 0 when QoS is enabled. |
| TxQoS0Octets (64 bit) | The total number of good bytes transmitted on queue 0 when QoS is enabled. |
| TxQoS1Pkts (32 bit) | The total number of good packets transmitted on queue 1 when QoS is enabled. |
| TxQoS1Octets (64 bit) | The total number of good bytes transmitted on queue 1 when QoS is enabled. |
| TxQoS2Pkts (32 bit) | The total number of good packets transmitted on queue 2 when QoS is enabled. |
| TxQoS2Octets (64 bit) | The total number of good bytes transmitted on queue 2 when QoS is enabled. |
| TxQoS3Pkts (32 bit) | The total number of good packets transmitted on queue 3 when QoS is enabled. |
| TxQoS3Octets (64 bit) | The total number of good bytes transmitted on queue 3 when QoS is enabled. |

*Table 30:  Transmit or Receive Counters (6)*

| Counters | Description |
|---|---|
| Pkts64Octets (32 bit) | The number of packets (including error packets) that are 64 bytes long. |
| Pkts65to127Octets (32 bit) | The number of packets (including error packets) that are between 65 and 127 bytes long. |
| Pkts128to255Octets (32 bit) | The number of packets (including error packets) that are between 128 and 255 bytes long. |
| Pkts256to511Octets (32 bit) | The number of packets (including error packets) that are between 256 and 511 bytes long. |
| Pkts512to1023Octets (32 bit) | The number of packets (including error packets) that are between 512 and 1023 bytes long. |
| Pkts1024toMaxOctets (32 bit) (Revision B silicon) | The number of packets (including error packets) that are between 1024 and MAX_RX_LIMIT bytes long. See Bit 2:1 at Table 51: "New Control Register (Page 00h: Address 03h)," on page 157. |
| Pkts1024to1522Octets (32 bit) (Revision A silicon) | The number of packets (including error packets) that are between 1024 and 1522 bytes long. |

# Total Number of Counters Per Port: 35

Table 31 identifies the mapping of the BCM53242M MIB counters and their generic mnemonics, to the specific counters and mnemonics for each of the key IETF MIBs which are supported (this is defined where there is a direct mapping). However, there are several additional statistics counters that are indirectly supported, which make up the full complement of the counters required to fully support each MIB. These are shown in Table 32 on page 100. Finally, Table 33 on page 100 identifies the additional counters supported by the BCM53242M, and references the specific standard or reason for the inclusion of the counter.

| Note 1 | – | – | – | etherStatsPkts |
| Note 1 | – | – | – | etherStatsCRCAlignErrors |
| Note 4 | dot3StatsSQETestErrors | – | – | – |

Note 1: Derived by summing two or more of the supported counters. See Table 32 on page 100 for specific details.

Note 2: Extensions required by recent Standards developments or BCM53242M operation specifics.

Note 3: The MIB II Interfaces specification for if OutOctets includes preamble/SFD and errored bytes. Because 802.3 compliant MACs have no requirement to keep track of the number of transmit bytes in an errored frame, this count is impossible to maintain. The TxOctets maintained by the BCM53242M is consistent with good bytes transmitted, excluding preamble but including FCS. The count can be adjusted to more closely match the if OutOctets definition by adding the preamble for TxGoodPkts, and possibly an estimate of the octets involved in TxCollisions and TxLateCollision.

Note 4: The attributes TxCarrierSenseErrors and TxSQETestErrors are not supported in the BCM53242M. These attributes were originally defined to support coax based AUI transceivers. The BCM53242M's integrated transceiver design means these error conditions are eliminated. MIBs intending to support such counters should return a value of 0 or not supported.

*Table 32:  Indirectly Supported MIB Counters*

| BCM53242M MIB | Ethernet-Like MIB RFC 1643 | Bridge MIB RFC 1493 | MIB II Interface RFC 1213/1573 | RMON MIB RFC 1757 |
|---|---|---|---|---|

| TxGoodPkts = TxUnicastPkts + TxMulticastPkts + TxBroadcastPkts | – | dot1dTpPortOut Frames | – | – |
| TxErrorPkts = TxExcessiveCollision + TxLateCollision Note 1 | – | – | ifOutErrors | – |

Note 1: The number of packets transmitted from a port which experienced late collision, or excessive collision. While for some media types in half-duplex operation, frames which experience carrier sense errors are also summed in this counter, the BCM53242M's integrated design means this error condition is eliminated.

# Section 4: System Interfaces

## Overview

The BCM53242M includes the following interfaces.

Each of these is discussed in more detail in the following sections.

## MII Port

The BCM53242M provides a fully 802.3u compatible MII interface as a twenty-fifth network port (port 48). The port can be configured to operate differently dependent on the programming of the internal registers.

## Network Port

In unmanaged mode after power-up, the MII operates as a normal MAC-based MII port, capable of interfacing directly to an external TX or FX transceiver. The port incorporates an internal MAC, and functions identically to the integrated 10/100 ports. Frames are forwarded to the port under control of the forwarding model.

Predecessors of the BCM53242M device allowed the MII management signals (MDC/MDIO) to interrogate the internal MII registers associated with the integrated 10/100 Mbps PHYs. The BCM53242M can still support this mode, in which case, configuration of the integrated PHYs requires the 2.5-MHz clock to be supplied to the BCM53242M MDC pin and any external MII-connected transceiver, and the external management device controls MDIO to select and configure all the PHYs appropriately. To operate in this mode, the external transceiver needs to support some signals in addition to the standard MII signals, so that the state of the external transceiver can be monitored by the BCM53242M. Individual active-low Link, Speed (100 Mbps), Duplex, and link partner Flow Control mode signals from the transceiver should be provided. An MII-based single 10/100 Mbps PHY, such as the BCM5202, provides these additional signals. With these additional signals, the BCM53242M generates port LEDs for the external MII-based PHY, equivalent to the LEDs of the internal transceivers.

The more typical use of the MII in a BCM53242M implementation is that the device is accessed via the SPI. In this case, on sensing activity of the SPI, the BCM53242M takes control of the MII management pins, and sources the 2.5-MHz clock signal for MDC. The external PHY can be accessed by the management entity, since its MII registers are aliased to the Port 48. Access to MII registers in this page in the register map automatically generates an MDIO/MDC request to the external MII-based transceiver, allowing configuration control and status monitoring of the off-chip PHY port.The MII port uses the unique PHY address of 18h. The external PHY must be programmed/strapped to respond to the PHY address of 18h. See "MDC/MDIO Interface" on page 114 for additional detail on internal and external PHY address values.

When an external transceiver is connected to the BCM53242M MII port and managed by the MDC/MDIO lines, the state of the link, speed, full/half-duplex and link partner flow control capabilities (among many others) can all be accessed via software, and need not be provided as hardware pins. In order to preserve LED display capabilities for the MII port, an additional alias register is provided in the Control registers (Page 0h), All the specific register information is temporary and subject to be change in the final version of the data sheet. This allows the state of the aforementioned status bits to be read from the external PHY and then written to this register, so that consistent LED status information for all 10/100 ports can be preserved.

If no MII-based external transceiver is present, page 28h of the register space is not present, and returns indeterminate data when read.

## Reverse MII Port

BCM53242M device includes an enhanced MII mode that supports direct MAC-to-MAC connectivity. The BCM53242M device supports a strap option selectable Reverse MII (RvMII) mode, which makes the BCM53242M MII interface appear as a 100-Mbps full-duplex PHY MII, as seen by the external MAC.

To support this RvMII mode, the clock-to-data timing has been modified. The TXC/RXC input clocks become 25-MHz clock outputs (identical to those of a PHY MII) that only support a 100-Mbps MII interface.

Rv MII mode is enabled by selecting the strap pin RvMII.

# Management Port (IMP)

The dedicated port can be used as a high-speed connection to transfer management packets to the external management agent. For more information, see "Frame Management" on page 88

# GMII/RGMII/TBI Port

## GMII

The Gigabit Media Independent Interface (GMII) is a MAC interface allowing the BCM53242M to connect to an external PHY. Transmit and receive data is clocked on the rising edge of the clocks. The GMII transmits data synchronously via the TXD[7:0] and RXD[7:0] data signals. The GTXCLK and RXC clock speeds are 125 MHz when the external PHY is operating at 1000 Mbps. The TXC and RXC clock speeds are reduced to 2.5 MHz and 25 MHz when the external PHY is linked at 10 Mbps and 100 Mbps, respectively. The external PHY status is monitored via the MDC/MDIO interface. The external GPHYs must be programmed/strapped to respond to the PHY address of 19h and 1Ah respectively.

# RGMII

The Reduced Gigabit Media Independent Interface (RGMII) is a MAC interface allowing the BCM53242M to connect to an external PHY. Transmit and receive data is clocked on both the rising and falling edge of the clocks. This reduces the number of data signals crossing the MAC interface without affecting the data transmission rate. The RGMII transmits data synchronously via the TXD[3:0] and RXD[3:0] data signals. The GTXCLK and RXC clock speeds are 125 MHz when the external PHY is operating at 1000 Mbps. These clock speeds are reduced to 2.5 MHz and 25 MHz when the external PHY is linked at 10 Mbps and 100 Mbps, respectively. The external PHY status is monitored via the MDC/MDIO interface.

# TBI

The Ten-Bit Interface (TBI) is a MAC interface allowing the BCM53242M to connect directly to the industrial standard SerDes for connecting to Gigabit Ethernet optical-fiber device. In the Ten-Bit mode, the TBI transmits the 10-bit encoded data via the TXD[9:0] signals synchronous to the GTXCLK at 125 MHz and receives data via RXD[9:0] signals synchronous to the TBI_RBC[1:0] clocks at 62.5 MHz.

Table 34 outlines the MIIGMII/RGMII/TBI interface I/O signal map of the BCM53242M.

# 10/100 Mbps Copper Interface

The internal PHYs transmit and receive data via the digiPHY. This section discusses the following topics:

- "Auto-Negotiation"
- "Automatic MDI Crossover"

- "10/100Base-T Forced Mode Auto-MDIX"

For more information on the integrated PHY block, see "Integrated PHY" on page 77.

## Auto-Negotiation

The BCM53242M negotiates its mode of operation over the copper media using the auto-negotiation mechanism defined in the IEEE 802.3u specifications. When the auto-negotiation function is enabled, the BCM53242M automatically chooses the mode of operation by advertising its abilities and comparing them with those received from its link partner. The BCM53242M can be configured to advertise the following modes:

- 100Base-TX full-duplex and/or half-duplex
- 10Base-T full-duplex and/or half-duplex

The transceiver negotiates with its link partner and chooses the highest common operating speed and duplex mode, commonly referred to as highest common denominator (HCD).

## Automatic MDI Crossover

During auto-negotiation, one end of the link needs to perform an MDI crossover so that each transceiver's transmitter is connected to the other receiver. The BCM53242M internal PHY can perform an automatic media dependent interface (MDI) crossover, eliminating the need for crossover cables or cross-wired (MDIX) ports.

During auto-negotiation, the BCM53242M internal PHY normally transmits on the TD± pin and receives on the RD± pin. When connecting to another device that does not perform MDI crossover, the BCM53242M internal PHY automatically switches its RD±/TD± pin pairs, when necessary, to communicate with the remote device. When connecting to another device that does have MDI crossover capability, an algorithm determines which end performs the crossover function. During 100Base-TX operation, pair swaps automatically occur within the device and do not require user intervention.

## 10/100Base-T Forced Mode Auto-MDIX

The Forced Mode Auto-MDIX feature allows the copper auto-negotiation to be disabled in either 10Base-T or 100Base-T and still take advantage of the automatic MDI crossover function. Whenever the forced link is down for at least four seconds, then auto-negotiation is internally enabled with its automatic MDI crossover function until link pulses or 100Base-Tx idles are detected. Once detected, the internal PHY returns to forced mode operation.

# Configuration Pins

Initial configuration of the BCM53242M takes place during power-on/reset by loading internal control values from hardware strap pins. The value of the pin is loaded when the reset sequence completes and the pin transitions to normal operation. Pull-up or pull-down resistors can be added to these pins to control the device configuration. If the pins are left floating, the default value is determined based on the internal pull-up or pull-down configuration.

# Programming Interfaces

The BCM53242M can be programmed via the SPI Interface, EEPROM Interface, or Extended Bus. The SPI interface provides access for a general purpose microcontroller, allowing read and write access to the internal BCM53242M register space. It is configured to be compatible with the Motorola® Serial Peripheral Interface (SPI) protocol. Alternatively, the EEPROM interface can be connected to an external EEPROM for writing register values upon power-up initialization.

A 16-bit or 8-bit extended bus interface on the BCM53242M is designed to provide connection to an external processor, allowing read and write accesses to the internal BCM53242M registers.

The internal address space of the BCM53242M device is broken into a number of pages. Each page groups a logical set of registers associated with a specific function. Each page provides a logical address space of 256 bytes, although, in general, only a small portion of the address space in each page is utilized.

## SPI Interface

The BCM53242M can be controlled over a serial interface that is compatible with a subset of the Motorola Synchronous Serial Peripheral Interconnect (SPI) bus. The microcontroller interface consists of four signals: serial clock (SCK), slave select (SS/CS), master-in/slave-out (MISO/DO) and master-out/slave-in (MOSI/DI). The BCM53242M always operates as an SPI slave device, in that it never initiates a transfer on the SPI and only responds to the read and write requests issued from a master device.

A layer of protocol is added to the basic SPI definition to facilitate transfers from the BCM53242M. This protocol establishes the definition of the first two bytes issued by the master to the BCM53242M slave during an SPI transfer. The first byte issued from the SPI master in any transaction is defined as a command byte, which is always followed by a register address byte, and any additional bytes are data bytes.

The SPI mode supports normal SPI determined by the content of the command byte. Table 35 shows the normal SPI command byte.

***Table 35:  Normal SPI Command Byte***

| 0 | 1 | 1 | MODE = 0 | CHIP ID 2 (MSB) | CHIP ID 1 | CHIP ID 0 (LSB) | Read/ Write (0/1) |
|---|---|---|----------|-----------------|-----------|------------------|-------------------|

The MODE bit (bit 4) of the command byte determines the meaning of bits 7:5. If bit 4 is a 0, it is a normal SPI command byte, and bits 7:5 should be defined as 011b.

In command bytes, bits[3:1] indicate the CHIP ID to be accessed. Because the BCM53242M operates as a single-chip system, the CHIP ID will be 000. Note that the SS# signal must also be active for any BCM53242M device to recognize that it is being accessed.

Bit 0 of the command byte is the R/W signal (0 = Read, 1 = Write) and determines the transmission direction of the data.

The byte following the command byte is an 8-bit register address. Initially, this sets the page address, followed by another command byte that contains the register base address in that page, which is used as the location to store the next byte of data received in the case of a write operation, or the next address from which to retrieve data in the case of a read operation. This base address increments as each byte of data is transmitted/received, allowing a contiguous block data from a register to be stored/read in a single transmission.

Noncontiguous blocks are also stored/read through the use of multiple transmissions, which allow a new command byte and register base address to be specified. The $\overline{SS}$ signal must remain low for the entire read or write transaction, as shown in Figure 20 on page 108 and Figure 21 on page 108, with the transaction terminated by the deassertion of the $\overline{SS}$ line by the master.

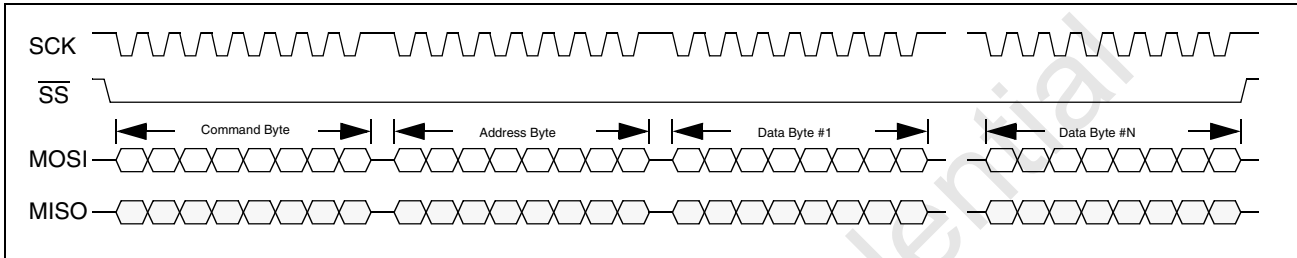

**Figure 20: SPI Serial Interface Write Operation**

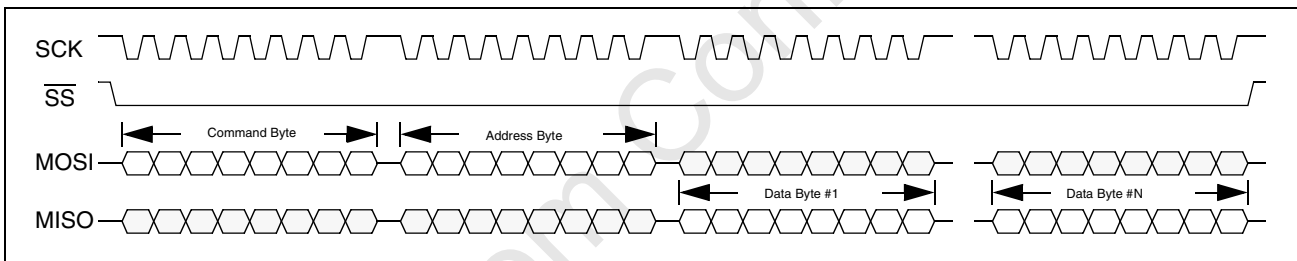

**Figure 21: SPI Serial Interface Read Operation**

The Serial Interface supports operation up to 2 MHz in SPI mode.

## Normal SPI Mode

Normal SPI mode allows single-byte read and multibyte string write operations, with the CPU polling to monitor progress. Read operations are performed using the SPI Status Register and SPI Data I/O Register. All read operations take the form:

<CMD, CHIP ID, R><REG ADDR>

where the first byte is the command byte with the appropriate CHIP ID and Read bits set, and the second byte is the register address.

All write operations are of the form:

<CMD, CHIP ID, W><REG ADDR><DATA0>...<DATAn>

where the first byte is the command byte with the appropriate CHIP ID and Write bits set, the second byte is the register address, and the remaining bytes are the exact number of data bytes appropriate for the selected register follow. Failure to provide the correct number of data bytes means the register write operation does not occur.

A simple flow chart for the read process is shown in Figure 22 on page 110.

To read a register, first the Page Register is written (<CMD, CHIP ID, W><REG ADDR = FFh><DATA = NEW PAGE>). It is only necessary to write the page register when moving to a new page. Once in the correct page, a read operation is performed on the appropriate register (<CMD, CHIP ID, R><REG ADDR>). Once the SPI Status Register indicates that the data is available (RACK = 1), the data can be read. Data is read from the SPI Data I/O Register, located at F0h–F7h on every page (so no page swap is necessary to read the data on any page). A read operation can access any or all of the bytes on a specific register, including the ability to start at any offset. For instance, reading from SPI Data I/O Register [0], reads the least significant byte of the register, and successive reads to SPI Data I/O Register [0] read the remaining bytes. However, reading the first byte from SPI Data I/O Register [2] reads the third byte of the register, and successive reads to SPI Data I/O Register [2] reads the remaining bytes of the register up to the most significant byte of the register. It is not necessary to read all bytes of a registers, only the bytes of interest. The SPI master can then move on to perform another read or write operation.

A flow chart for the write process is shown in Figure 23 on page 111. To write a register, the Page Register is written if necessary (<CMD, CHIP ID, W><REG ADDR = FFh><DATA = NEW PAGE>), then data is written to the selected register (<CMD, CHIP ID, W><REG ADDR><DATA0>...<DATAn>), where DATA0 is the least significant byte of the register, and DATAn is the most significant byte of the register, and the exact number of bytes is present as defined by the register width. No byte offset is provided for write operations, and all bytes must be present to activate the write process internal to the BCM53242M.

The following simple rules apply to the normal SPI mode:

- A write to the page register at any time causes the SPI state machine to reset.
- A read operation can access any number of bytes at any offset using the SPI Data I/O Register.
- A write operation must write the exact number of bytes to the register being accessed.
- The RXRDY/TXRDY flags in SPI Status Register must be checked after each 8-byte string has been read/ written to ensure the next string is ready and can be accepted (since the largest internal register is 8 bytes, this restriction only applies to reading and writing frames via the SPI).
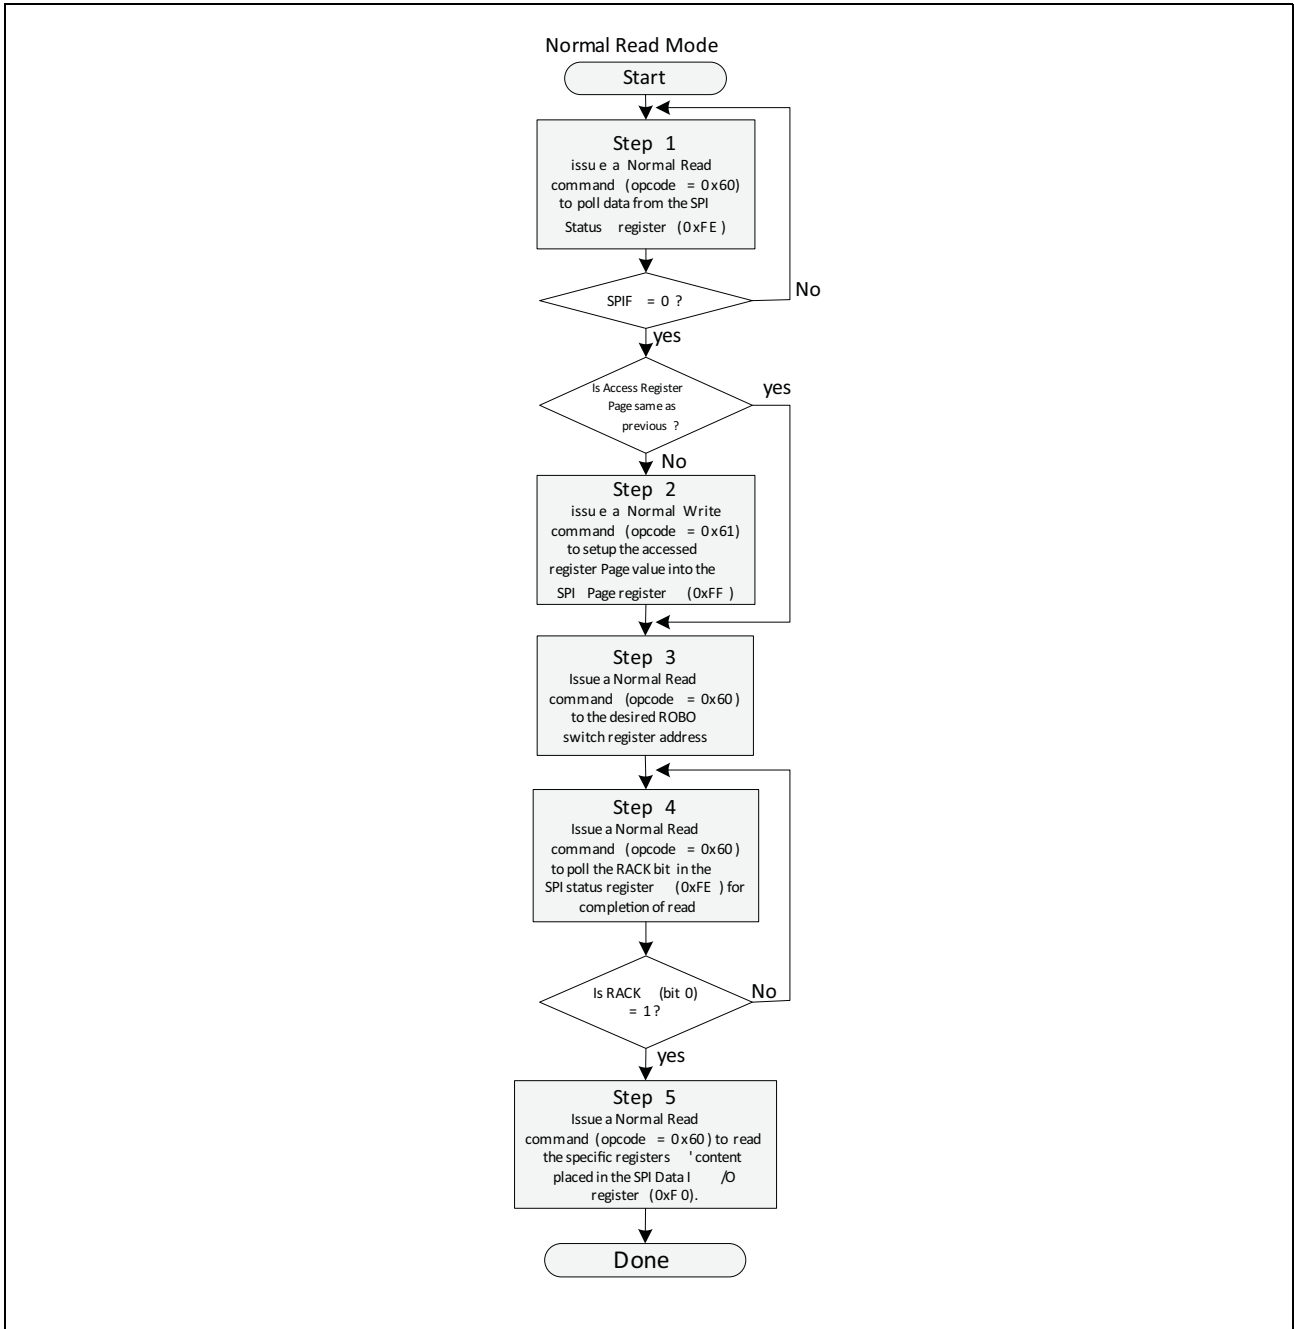

**Figure 22: Normal SPI Mode Read Flow Chrt**

**Normal Write Mode**

Start

**Step 1**
issue a Normal Read command (opcode = 0x60) to poll data from the SPI Status register (0xFE)

SPIF = 0 ? — No

yes

Is Access Register Page same as previous ? — yes

No

**Step 1**
Issue a Normal Write command (opcode = 0x61) to setup the accessed register Page value in the Page Register (0xFF)

**Step 2**
Issue a Normal Write command (opcode = 0x61) to setup the accessed register Address value, followed by the write content starting from a lower byte

Done

**Figure 23:  Normal SPI Mode Write Flow Chart**

# EEPROM Interface

The BCM53242M can be connected via the Serial Interface to a low-cost external serial EEPROM, enabling it to download register programming instructions during power-on initialization.For each programming instruction fetched from the EEPROM, the instruction executes immediately and affects the register file.

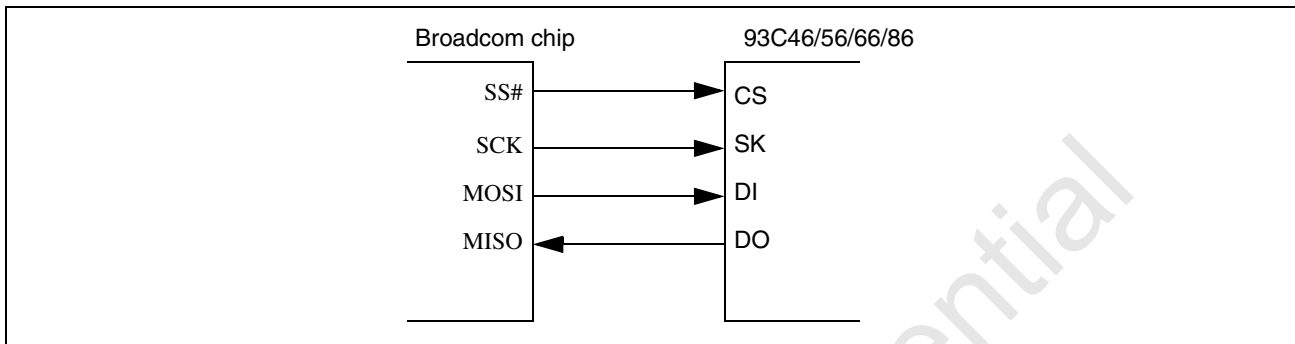

**Figure 24:  Serial EEPROM Connection**

During the chip initialization phase, the data is sequentially read-in from the EEPROM after the internal memory has been cleared. The first data read-in is the HEADER and matches a predefined magic code. In the case where the HEADER data does not match the instruction fetch, the process stops, and the EEPROM controller treats it as if no EEPROM exists. If the magic code matches, the fetch instruction process continues until it reaches the instruction length defined in the HEADER.

The BCM53242M supports EEPROMs with varying capacities. These include the 93C46, 93C56, 93C66 and 93C86. The BCM53242M implements the automatic detection of EEPROM types. The two EEPROM_TYPE[1:0] strap pins are designated as "don't cares" and "can be ignored".

## EEPROM Format

The EEPROM should be configured to x16 word format. The header contains a key and length information as in Table 36.

- Upper 5 bits are magic code 15h, which indicates valid data follows.
- Bit 10 is for speed indication. A 0 means normal speed. A 1 indicates speed up. The default is 0.
- Lower 10 bits indicate the total length of all entries. For example:
  - 93C46 up to 64 words
  - 93C56 up to 128 words
  - 93C66 up to 256 words
  - 93C86 up to 1024 words

*Table 36:  EEPROM Header Format*

| 15:11 | 10 | 9:0 |
|---|---|---|
| Magic code, 15h | Speed | Total Entry Number<br>• 93C46: 0–63<br>• 93C56: 0–127<br>• 93C66: 0–255<br>• 93C86: 0–1023 |

After chip initialization, the header is read from the EEPROM and used to compare to the pre-defined magic code. When the fetched data does not match the predefined magic code, the EEPROM instruction fetch process is stopped. If the magic code is matched, fetching instructions continues until the instruction length as defined in the HEADER.

The EEPROM Port shares pins with the SPI port. Either the SPI port or the EEPROM can be selected by using the strap pin, CPU_EEPROM_SEL. The register space for the EEPROM port is the same as for the SPI port.

Contact your local Broadcom FAE for EEPROM Programming Guide for more details on EEPROM data format.

# MDC/MDIO Interface

## MDC/MDIO Master Interface

Each of the external transceivers can be daisy-chained to the MDC and MDIO pins of the BCM53242M. The BCM53242M uses the MDC/MDIO interface to read/write the register information of the external transceivers.

The BCM53242M initiates a master MII access cycle when:

- Automatically polling the external PHY MII registers, unless the PHY_POLL_DIS strap pin is deliberately pulled high
- Any SCK activity is detected on the SPI interface to access the external PHY MII registers

Each external transceiver is assigned a unique hardware PHY address for MII management. The IMP port hardware PHY address is 18h. Gigabit ports G0 and G1 have hardware PHY addresses 19h and 1Ah respectively.

Each time a master MII write or read operation is executed, the transceiver compares the PHY address with its own PHY address definition. The operation is executed only when the addresses match.

> **Note:** When a master MII access cycle is executed, the BCM53242M sources a 2.5 MHz clock on the MDC pin.

## MDC/MDIO Slave Interface

The BCM53242M executes a MII slave access cycle, when the CPU initiates a read/write access to either the switch registers or the internal transceiver MII registers.

## Switch Register Access Through Pseudo-PHY Interface

The switch registers are organized into pages, each of which contains a defined register set. To access any switch register, both the page number and register address must be specified.

The CPU can access the BCM53242M switch registers through the MDC and MDIO interface. The switch registers are accessed through a pseudo-PHY (PHY Address = 01E), which is not used by any of the physical transceivers on the BCM53242M MDC/MDIO path. Page number, register address and the read/write data are encapsulated in the MII management frame format.

The algorithm for read access to the switch registers is shown in Figure 33 on page 121. The algorithm for write access is shown in Figure 34 on page 122. The pseudo-PHY MDC/MDIO interface has an address space of 32, as shown in Figure 26 on page 118. The first 16 registers are reserved by IEEE. Only addresses 16-31 can be used to access the switch registers. The switch register page number, register address, and access type are determined by registers 16 and 17. The data read from or written to a switch register is stored in registers 24 to 27 (64 bits total).

# MDC/MDIO Slave Interface Register Programming

Each internal transceiver in the BCM53242M is assigned a unique hardware PHY address.

Transceiver 0 has address 00000. Transceivers 1-23 have addresses 1 through 17h, respectively.

Each internal PHY checks that the PHY address of the initiated command matches that of its own before executing the command.

The BCM53242M fully complies with the IEEE 802.3u Media Independent Interface (MII) specification. The MII management interface registers of each internal transceiver are serially written-to and read-from using a common set of MDIO and MDC pins. A single clock must be provided to the BCM53242M at a rate of 0-12.5 MHz through the MDC pin.

The serial data is communicated on the MDIO pin. Every MDIO bit must have the same period as the MDC clock. The MDIO bits are latched on the rising edge of the MDC clock. MDC may be stopped between frames provided no timing requirements are violated. MDC must be active during each valid bit of every frame, including preamble, instruction, address, data, and at least one idle bit. Every MII read or write instruction frame contains the fields shown in Table 37.

*Table 37:  MII Management Frame Format*

| Operation | PRE | ST | OP | PHYAD | REGAD | TA | DATA | IDle | Direction |
|---|---|---|---|---|---|---|---|---|---|
| Read | 1 ... 1 | 01 | 10 | AAAAA | RRRRR | ZZ | Z ... Z | Z | Driven to BCM53242M |
|  |  |  |  |  |  | Z0 | D ... D | Z | Driven by BCM53242M |
| Write | 1 ... 1 | 01 | 01 | AAAAA | RRRRR | 10 | D ... D | Z | Driven to BCM53242M |

## Preamble (PRE)

32 consecutive 1 bits must be sent through the MDIO pin to the BCM53242M to signal the beginning of an MII instruction. Fewer than 32 1 bits will cause the remainder of the instruction to be ignored. In preamble suppression mode, only two preamble bits are required between frames.

## Start of Frame (ST)

A 01 pattern indicates that the start of the instruction follows.

## Operation Code (OP)

A read instruction is indicated by 10, while a WRITE instruction is indicated by 01.

## PHY Address (PHYAD)

A 5-bit PHY address follows next, with the MSB transmitted first. The PHY address allows a single MDIO bus to access multiple PHY chips.

## Register Address (REGAD)

A 5-bit Register Address follows, with the MSB transmitted first. The register map of the BCM53242M, containing register addresses and bit definitions, are provided on the following pages.

## Turnaround (TA)

The next two bit times are used to avoid contention on the MDIO pin when a read operation is performed. For a Write operation, 10 must be sent to the BCM53242M chip during these two bit times. For a read operation, the MDIO pin must be placed into high-impedance during these two bit times. The chip drives the MDIO pin to 0 during the second bit time.

## Data

The last 16 bits of the frame are the actual data bits. For a write operation, these bits are sent to the BCM53242M, whereas, for a read operation, these bits are driven by the BCM53242M. In either case, the MSB is transmitted first. When writing to the BCM53242M, the data field bits must be stable during the rising edge of MDC. When reading from the BCM53242M, the data field bits are valid after the rising-edge of MDC until the next rising-edge of MDC.

## Idle

A high impedance state of the MDIO line. All tri-state drivers are disabled and an external pull-up resistor pulls the MDIO line to logic 1. At least one or more clocked idle states are required between frames.

Following are two examples of MII write and read instructions:

To put a transceiver with PHY address 00001 into Loopback mode, the following MII write instruction must be issued:

- 1111 1111 1111 1111 1111 1111 1111 1111    0101 00001 00000 10 0100 0000 0000 0000

To determine if a PHY is in the link pass state, the following MII read instruction must be issued:

- 1111 1111 1111 1111 1111 1111 1111 1111    0110 00001 00001 ZZ ZZZZ ZZZZ ZZZZ ZZZZ

For the MII read operation, the BCM53242M will drive the MDIO line during the second half of the TA field and the Data field (the last 17 bit times).

# LED Interfaces

The BCM53242M series consists of several devices with different port configurations. The serial LED shift sequence for all these devices is identical except for the difference in port configuration. Figure 35 on page 124 shows the typical serial LED bit stream in the highest port count configuration. Table 38 shows the valid serial LED bit stream for the specific device.

*Table 38:  Valid Serial LED Bit Stream Port Map*

| Device | Valid FE Stream | Null FE Stream | Valid GE Stream |
|---|---|---|---|
| BCM53242M | P0 ~ P23 | None | G0, G1 |

The BCM53242M provides visibility for up to 5 status indications per port. A serial interface is supplied to drive the status to the LEDs. The serial interface provides per port of link status, port speed, duplex mode, combined transmit and receive activity, and collision. During power-on and reset, the serial interface shifts a continuous low value for 1.34s.

## Serial LED Interface

A two-pin serial interface, LEDDATA and LEDCLK, provides data and clock to enable external shift registers to capture the LED status indications from the BCM53242M for each internal port. The LED status of the MII port is excluded since it is intended for use as an IMP port. The status encapsulated within the shift sequence is configured by the LED mode configuration signals. The configuration signals select both the number of status bits per port and the status type of each bit.

The LEDCLK is generated by dividing the 25-MHz input clock by 8, providing a 320-ns clock period. The LEDDATA outputs are generated on the falling edge of the LEDCLK, and have adequate setup and hold time to be clocked externally on the rising edge of LEDCLK.

The shift sequence is per port Status words. Each port status word contains up to 5 bit for the designated LED status type as mentioned above. Port 0 status word is shifted out first, followed by Port 1, ..., Port 23 and GigaPort G0 and G1 status words. The shift sequence is repeated every 42 ms.

Refer to Figure 35 on page 124 for an illustration of the serial LED shift sequence, Table 39: "LED Status Types," on page 124 for LED status Type, and Table 40 on page 125 for LED mode matrix.
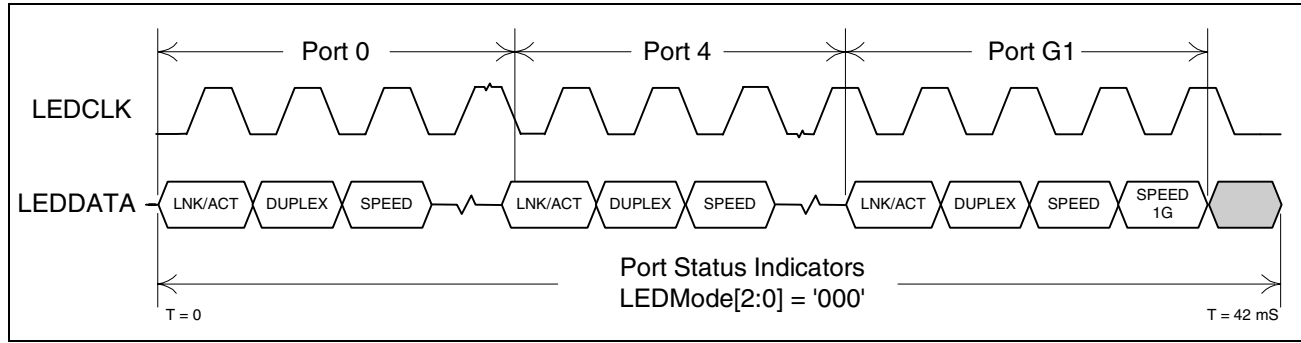

**Figure 35:  Serial LED Shift Sequence LEDMODE[2:0] = '000'**

*Table 39:  LED Status Types*

| Name | Description |
|---|---|
| LNK | **Link status indicator.** Low when link is established. High when link is off. |
| LNK/ACT | **Link and Activity status indicator.** Low when link is established. Blinking at 12 Hz when link is up and port is transmitting and receiving. |
| LNK/ACT/SPD | **Link, Activity and Speed indicator.** Low when link is up. Blinking at 3 Hz when port has activity (transmitting or receiving) in 10-Mb mode. Blinking at 6 Hz when there is activity at 100-Mb mode and blinking at 12 Hz when activity in 1000-Mb mode. |
| LNKG/ACTF | **1G Link, 10/100 Activity indicator.** Low when 1000-Mb link is upBlinking at 12 Hz when there is activity in 10 Mb/100 Mb mode. High in all other cases. |
| LNKF/ACTG | **10/100 Link, 1G Activity indicator.** Low when 10 Mb/100 Mb link is up. Blinking at 12 Hz when there is activity in 1000-Mb mode. High in all other cases. |
| DUPLEX | **Duplex mode indicator.** High for half-duplex or no link, and low for full-duplex and link. |
| DPX/COL | **Duplex and Collision indicator.** Blinking when collision is detected. Low for full-duplex and link. |
| SPEED | **Speed indicator.** High for 10 Mbps or no link. Low for 100 Mbps and link |
| SPEED1G | **Speed indicator.** Low for link at 1000 Mbps. High for all other conditions. |
| ACT | **Activity.** Low for 42 ms when transmit or receive activity is detected during previous 42-ms interval. High during no activity or no link. |
| COLSN | **Collision.** Low for 42 ms when collision is detected during the previous 42-ms interval. High in the absence of collisions or no link. |

# Programming LED Registers

The BCM53242M implements a versatile LED scheme. To obtain the shift sequence as outlined in
Table 40: "Serial LED Mode Matrix Shift Sequence," on page 125, program the LED register using Table 41.

*Table 41:* BCM53242M *Legacy LED Shift Sequence Register Programming*

# JTAG Interface

A standard JTAG interface is provided for boundary scan operations. This interface uses the standard five-pin interface, and supports operation at speeds up to 20 MHz.

# Internal Voltage Regulators

Two voltage regulators are provided to ease power supply requirements for system that may otherwise lack 2.5V or 1.2V power supply. An external PNP transistor is required for each of the regulators as show in Figure 40 on page 131. The 1.2V regulator source/emitter pins must be supplied with 2.5V, and the 2.5V regulator source/emitter pins must be supplied with 3.3V. The REGSEN output pins are brought out to allow filtering and power distribution. The REGSENs should not be connected together. Connecting these outputs together can cause one of the regulators to supply all the power or cause the regulators to oscillate.

Place PNP transistors within 0.5 inches of the BCM53242M. The traces connected between PNP pins and BCM53242M device should be at least 5 mils wide. The PNP transistor's emitter and collector should use a plane or a 20-mil or larger trace to prevent IR drops and to ensure a low impedance path. A minimum of one 10-µF capacitor with an ESR of less than 0.5 ohms and one 0.1-µF output-filter capacitor is needed for the transistor's collector and emitter pin. Place these capacitors within 0.5 inches of the collector pins. For additional margin, the transistor's collector current should be rated at least two times the supply current.

When selecting an external PNP transistor to use for the BCM53242M regulator, the following parameters must be taken into consideration:

- $h_{FE}$ (DC Current Gain) greater than 40, for the operating conditions.
- $V_{CE}$ at the max intended load greater than 300 mV.
- Current capacity greater than that required for the power supply.
- Power dissipation capacity at max system temp and voltage.
- Form factor (size, lead type, surface mount, through-hole, etc.

The Broadcom-recommended external PNP transistors include the MMJT9435 and MJD45H11 from Motorola/ON Semiconductor. Information about these transistors can be found at the OnSemi web site at www.onsemi.com.
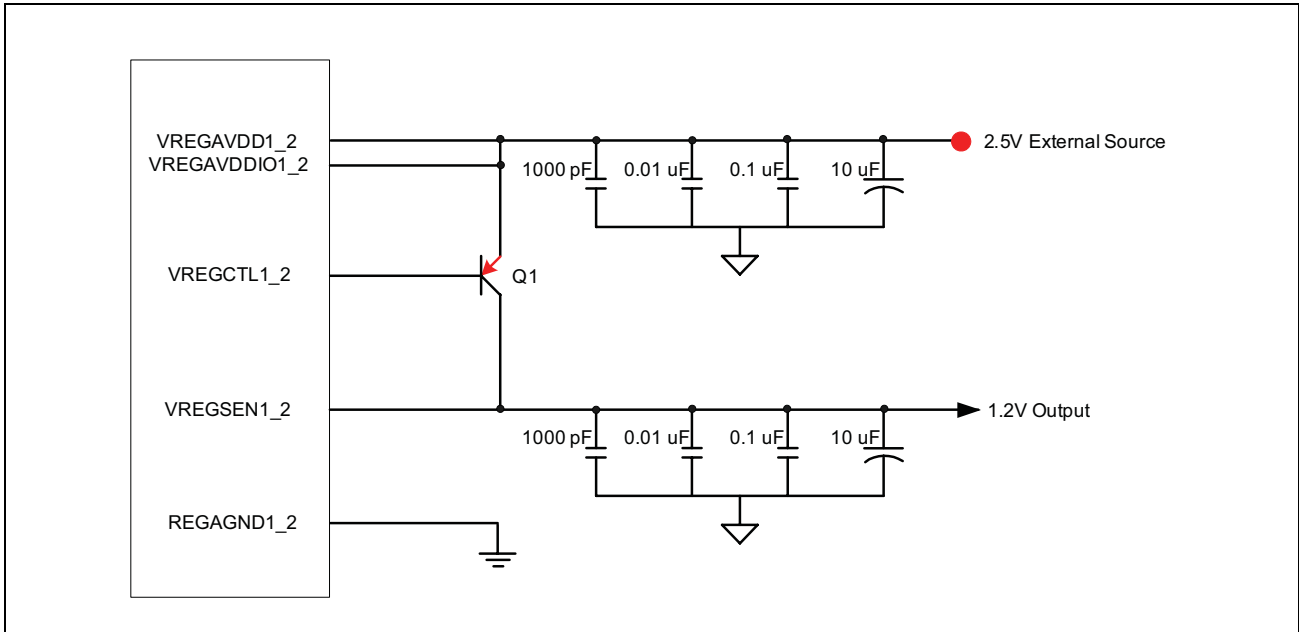

**Figure 39:  External PNP for 1.2V Voltage Regulators**

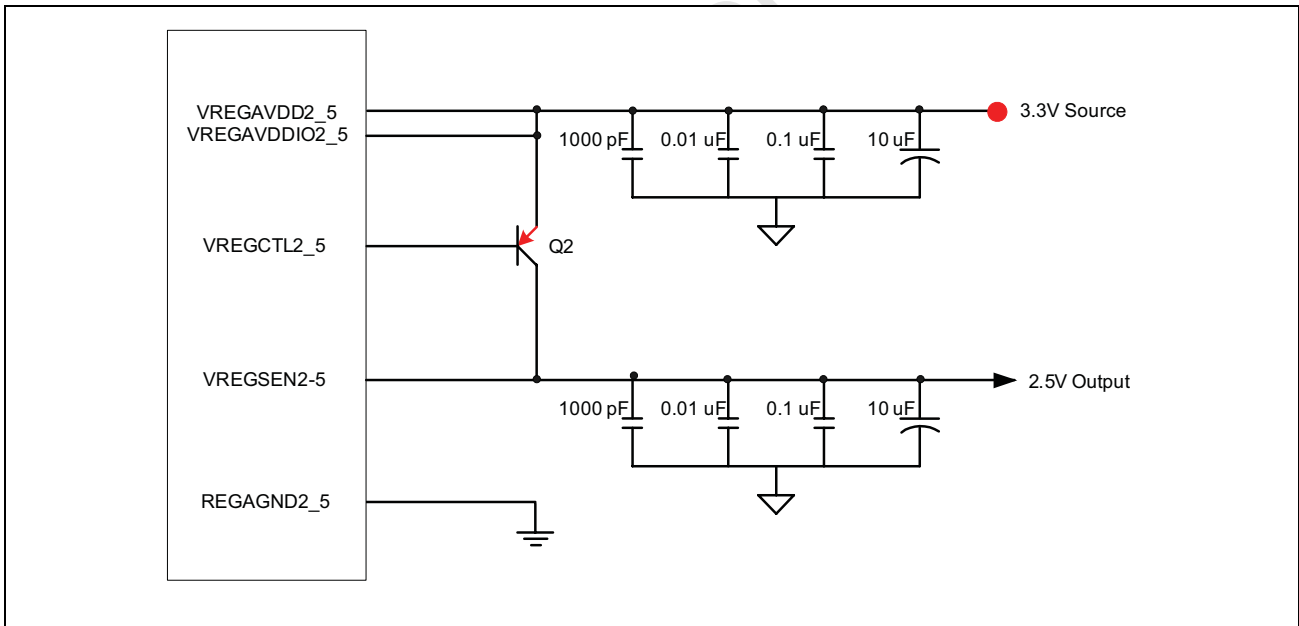

**Figure 40:  External PNP for 2.5V Voltage Regulators**

**Note:** Do not supply the 1.2V regulator from the output of the 2.5V regulator.

# Section 5: BCM53242M Hardware Signal Definitions

Table 42 lists the conventions used to identify the I/O types in Table 43.

*Table 42:  I/O Signal Type Definitions*

| Type | Description | Type | Description |
|------|-------------|------|-------------|
| I | Input | O | Output |
| I/O | Bi-directional | $O_{OD}$ | Open drain output |
| $I_{PD}$ | Input with internal pull-down | $O_{ODPM}$ | Open drain power management output |
| $I_{PU}$ | Input with internal pull-up | $O_{3S}$ | Tristated signal |
| $I_S$ | Input with Schmidt Trigger | B | Bias |
| GND | Ground | A | Analog |
| PWR | Power supply | OVERLINE | Active low signal |

Pin number in *Italic* font indicates pin is shared with multiple functions.

Configuration of the BCM53242M takes place during reset by loading device control values from hardware strapping pins. Some of the strapping pins are I/O pins and have secondary function during normal device operation. These pins should be configured with external pull-up or pull-down resistors. The strapping value is loaded during the reset sequence and the I/O pin returns to output operation after the completion of reset. Installing a pull-up or pull-down resistor to these pins other than the intended default value can have an adverse affect on the function of the device.

*Clock/Reset*

| Signal Name | Ball # | Type | Drive (mA) | Description |
|---|---|---|---|---|
| $\overline{\text{RESET}}$ | C4 | I$_{S,PU}$ | – | **Reset.** Active-low. Resets the BCM53242M. |
| XTALI | V19 | I | – | **25-MHz Crystal/Clock Input.** |
| XTALO | V20 | O | | For a single-ended clock signal input, connect a 25.000 (±50 ppm) MHz reference clock to the XTALI pin. This pin must be driven with a continuous clock. Leave XTALO unconnected for this mode of operation. |
| | | | | Alternatively, a 25.000 MHz parallel-resonant crystal can be connected between the XTALI/XTALO pins, with a 22 pF capacitor from each pin to GND. |

*MII Interface*

| Signal Name | Ball # | Type | Drive (mA) | Description |
|---|---|---|---|---|
| CRS | D9 | I$_{PD}$ | – | **Carrier Sense.** Active-high. Indicates traffic on link. |
| COL | C9 | I$_{PD}$ | – | **Collision Detect.** In half-duplex mode, active-high input indicates that a collision has occurred. In full-duplex mode, COL remains low. COL is an asynchronous input signal. |

*Table 43:  Hardware Signal Definitions  (Cont.)*

| Signal Name | Ball # | Type | Drive (mA) | Description |
|---|---|---|---|---|
| MDIO | C5 | I/O$_{PD}$ | 8 | **Management Data I/O.** This serial input/output bit is used to read from and write to the MII registers of the internal transceivers. The input data value on the MDIO pin is valid and latched on the rising edge of MDC. |
| MDC | B5 | I/O$_{PD}$ | 8 | **Management Data Clock.** MDC must be provided to the BCM53242M as an input to allow MII management functions. Clock frequencies up to 12.5 MHz are supported. If the BCM53242M detects SCK activity on the SPI interface, the BCM53242M sources a 2.5-MHz clock to the external PHY device. |
| RXCLK | B7 | I/O$_{PD}$ | 8 | **Receive Clock.** 25 MHz input in 100Base-X mode and 2.5 MHz input in 10Base-T mode. RXC is expected to be continuously running. RXC may have an irregular period when RXDV= 0 at the beginning of a packet. |
| RXD[3] | A5 | I$_{PD}$ | – | **Receive Data Inputs.** Nibble-wide receive data. RXD[3] is the most significant bit. |
| RXD[2] | C6 | I$_{PD}$ | | |
| RXD[1] | B6 | I$_{PD}$ | | |
| RXD[0] | A6 | I$_{PD}$ | | |
| RXDV | A7 | I$_{PD}$ | – | **Receive Data Valid.** Active-high. Indicates that a receive frame is in progress, and that the data stream present on the RXD input pins is valid. |
| RXER | C7 | I$_{PD}$ | – | **Receive Error Detected.** Active-high. Indicates that there has been an error during a receive frame. |
| TXCLK | A8 | I/O$_{PD}$ | 8 | **Transmit Clock.** For MII mode, 25 MHz input in 100Base-X mode and 2.5 MHz in 10Base-T mode. This clock must be a continuously driven input, generated from the PHY. |
| TXD[3] | B9 | I/O$_{PU}$ | 8 | **Transmit Data Output.** Nibble-wide transmit data is output on these pins synchronously to TXC. TXD[3] is the most significant bit. |
| TXD[2] | A9 | | | |
| TXD[1] | D8 | | | |
| TXD[0] | C8 | | | |
| TXEN | B8 | I/O$_{PD}$ | 8 | **Transmit Enable.** Indicates that the data nibble is valid on TXD[3:0]. |
| TXER | D7 | I/O$_{PD}$ | 8 | **Transmit Error.** Asserted while TXEN is active to force a bad code into the transmit data stream. |
| *MII Interface Configuration* | | | | |
| RvMII_EN | C1 | I/O$_{PD}$ | – | **MII or Reversed MII Interface Selection.** Set to enable MII Interface to appear as a 100 Mbps full duplex PHY MII, as seen by the external MAC. Under this mode, the TXCLK/RXCLK become 25-MHz clock outputs. |

*Table 43:  Hardware Signal Definitions  (Cont.)*

| Signal Name | Ball # | Type | Drive (mA) | Description |
|---|---|---|---|---|
| *Dual GMII/RGMII/MII/TBI Interfaces* | | | | |
| *Note:* If not used, all GMII input pins should be pulled-down. All GMII output pins can be left floating if not used. | | | | |
| GMII1_CRS<br>GMII0_CRS | A17<br>K17 | I | – | **Carrier Sense.**<br>Active-high. Indicates traffic on link. GMII(0:1)_CRS is asserted when a non-idle condition is detected in the receive data stream. GMII(0:1)_CRS is deasserted when idle or a valid end of stream delimiter is detected. In half-duplex mode, GMII(0:1)_CRS is also asserted during transmission of packets. GMII(0:1)_CRS is an asynchronous input signal. |
| GMII1_COL<br>GMII0_COL | C16<br>J17 | I | – | Collision **Detect**.<br>Active-high. Indicates collision on the link. GMII(0:1)_COL is asserted when both GMII(0:1)_TX_EN and GMII(0:1)_CRS are high in half-duplex operation. This is only valid for MII operation. In full-duplex mode, GMII(0:1)_COL remains low. GMII(0:1)_COL is an asynchronous input signal. |
| GMII1_GTXCLK<br>GMII0_GTXCLK | A13<br>C20 | O | – | **Transmit Clock.** 125-MHz Output. This clock is continuously driven from the MAC. It is used to synchronize the transmit data in 1000Base-T (GMII, TBI, or RGMII) mode. |
| MII1_TXC<br>MII0_TXC | A10<br>D17 | I/O | – | **MII Transmit Clock.** This clock is used to synchronize the transmit data in MII mode. This clock input is 25-MHz in 100Base-TX mode and 2.5-MHz in 10Base-T mode. This clock must be a continuously driven input, generated from the PHY. |

*Table 43:  Hardware Signal Definitions  (Cont.)*

| Signal Name | Ball # | Type | Drive (mA) | Description |
|---|---|---|---|---|
| GMII1_TXD[7]<br>GMII1_TXD[6]<br>GMII1_TXD[5]<br>GMII1_TXD[4]<br>GMII1_TXD[3]<br>GMII1_TXD[2]<br>GMII1_TXD[1]<br>GMII1_TXD[0]<br><br>GMII0_TXD[7]<br>GMII0_TXD[6]<br>GMII0_TXD[5]<br>GMII0_TXD[4]<br>GMII0_TXD[3]<br>GMII0_TXD[2]<br>GMII0_TXD[1]<br>GMII0_TXD[0] | C12<br>B12<br>A12<br>C11<br>B11<br>A11<br>C10<br>B10<br><br>C19<br>B19<br>A19<br>C18<br>B18<br>A18<br>C17<br>B17 | O | – | **Transmit Data Outputs.** Byte-wide transmit data is output synchronous to the GMII or MII Transmit Clock. GMII(0:1)_TXD[7] is the most significant bit. GMII(0:1)_TXD[7:0] are used in GMII and TBI mode.<br><br>In 10Base-T, 100Base-TX, and RGMII mode, only GMII(0:1)_TXD[3:0] are used. GMII(0:1)_TXD[3] is the most significant bit. |
| GMII1_TX_EN<br>GMII0_TX_EN | D11<br>A20 | O | – | **Transmit Enable.** Active-high. When GMII(0:1)_TX_EN is asserted, the data on the GMII(0:1)_TXD pins is encoded and transmitted. GMII(0:1)_TX_ER are used as GMII(0:1)_TXD[9] in TBI mode. |
| GMII1_TX_ER<br>GMII0_TX_ER | D12<br>B20 | O | – | **Transmit Error.** Active-high. Asserting GMII(0:1)_TX_ER when GMII(0:1)_TX_EN is high causes transmission of the designated bad code in lieu of normal encoded data. |
| GMII1_RXCLK<br>GMII0_RXCLK | B13<br>D20 | I | – | **Receive Clock.** 2.5/25/125-MHz input. This clock is recovered from the incoming analog waveforms and is used to synchronize the receive data:<br>• 1000Base-TX mode; the clock is 125 MHz, byte-aligned on GMII(0:1)_RXD[7:0].<br>• 100Base-TX mode; the clock is 25 MHz, nibble-aligned on GMII(0:1)_RXD[3:0].<br>• 10Base-T mode; the clock is 2.5 MHz, nibble-aligned on GMII(0:1)_RXD[3:0]. |

*Table 43:  Hardware Signal Definitions  (Cont.)*

| **SPI** | | | | |
| MISO | B3 | $O_{3S}$ | 8 | **Master-In/Slave-Out.** Output signal from the BCM53242M driven with serial data during a Serial Management Port Read operation.<br><br>Shared with EEPROM's DO. |
| MOSI | A3 | $I_{PU}$ | – | **Master-Out/Slave-In.** Input signal which receives control and address information for the Serial Management Port, as well as serial data during Write operations.<br><br>Shared with EEPROM's DI. |
| SCK | D5 | $I/O_{PD}$ | 8 | **Serial Clock.** Clock input to the Serial Management Port supplied by the SPI master. Supports up to 2 MHz.<br><br>Shared with EEPROM's SCK. |
| $\overline{SS}$ | D4 | $I/O_{PU}$ | 8 | **Slave Select.** Active-low signal which enables a Serial Management Port Read or Write operation.<br><br>Shared with the EEPROM's CS. |
| **EEPROM** | | | | |
| CS | D4 | $O_{PU}$ | 8 | **Chip Select.** Active-high signal which enables an EEPROM read operation.<br><br>Shared with SPI's SS. |
| DI | A3 | $O_{PU}$ | 8 | **Data In.** Serial data input to the external EEPROM.<br><br>Shared with SPI's MOSI. |

*Table 43: Hardware Signal Definitions (Cont.)*

| Signal Name | Ball # | Type | Drive (mA) | Description |
|---|---|---|---|---|
| DO | B3 | I$_{PU}$ | – | **Data Out.** Serial data output from the external EEPROM. <br><br> Shared with SPI's MISO. |
| SCK | D5 | O$_{PD}$ | 8 | **Serial Data Clock.** Clock output to the EEPROM supplied by the BCM53242M. <br><br> Shared with SPI's SCK. |
| *Test Interface* | | | | |
| TCK | H3 | I$_{PU}$ | – | **JTAG Test Clock Input.** Clock input used to synchronize JTAG control and data transfers. If unused, may be left unconnected. |
| TDI | G1 | I$_{PU}$ | – | **JTAG Test Data Input.** Serial data input to the JTAG TAP Controller. Sampled on the rising edge of TCK. If unused, may be left unconnected. |
| TDO | H2 | O$_{3S}$ | 8 | **JTAG Test Data Output.** Serial data output from the JTAG TAP Controller. Updated on the falling edge of TCK. Actively driven both high and low when enabled; high impedance otherwise. |
| TMS | G2 | I$_{PU}$ | – | **JTAG Mode Select Input.** Single control input to the JTAG TAP Controller used to traverse the test-logic state machine. Sampled on the rising edge of TCK. If unused, may be left unconnected. |
| $\overline{\text{TRST}}$ | F1 | I$_{PU}$ | – | **JTAG Test Reset.** Asynchronous active-low reset input to the JTAG TAP Controller. The TRST input must be driven low to insure the TAP controller initializes to the proper state. <br><br> *Note:* A 4.7K external pull-down resistor is required on this pin to ensure proper initialization. |
| *Configuration* | | | | |
| CPU_EEPROM_SEL | F4 | I/O$_{PU}$ | – | **CPU or EEPROM Interface Selection.** <br> • CPU_EEPROM_SEL = 0: Disables SPI interface, and allows for connection to EEPROM. <br> • CPU_EEPROM_SEL = 1: Configures SPI interface to connect to CPU. |
| EEPROM_TYPE1 <br> EEPROM_TYPE0 | C2 <br> D3 | I/O$_{PD}$ <br> I/O$_{PD}$ | – | **EEPROM Type Select.** The EEPROM type is automatically detected by the BCM53242M. These two strap pins are essentially don't cares and can be ignored. See "EEPROM Interface" on page 112 for more information. |
| ENFDXFLOW | E9 | I/O$_{PU}$ | – | **Enable Automatic Full Duplex Flow Control.** In combination with the results of auto-negotiation, sets the flow control mode. Refer to Table 8: "Flow Control Modes," on page 77 for more information. |

*Table 43:  Hardware Signal Definitions  (Cont.)*

| Signal Name | Ball # | Type | Drive (mA) | Description |
|---|---|---|---|---|
| ENHDXFLOW | E10 | I/O$_{PU}$ | – | **Enable Automatic Backpressure.**<br>• ENHDXFLOW =0: 10/100 ports half-duplex flow control is disabled.<br>• ENHDXFLOW =1: 10/100 ports half-duplex flow control is enabled.<br><br>See Table 8: "Flow Control Modes," on page 77 for more information. |
| EN_GRX_FLOW | E3 | I/O$_{PU}$ | – | **Enable Gigabit Receive Flow Control.**<br>• EN_GRX_FLOW = 0: Gigabit ports Half-duplex flow control is disabled.<br>• EN_GRX_FLOW = 1: Gigabit ports Half-duplex flow control is enabled. |
| HW_FWDG_EN | A2 | I/O$_{PU}$ | – | **Forwarding Enable.**<br>• HW_FWDG_EN = 0: Frame forwarding is disabled at power-up. Typically implemented to support compliant 802.1 Spanning Tree Protocol in a managed application.<br>• HW_FWDG_EN = 1: Frame forwarding is enabled (typical for unmanaged applications). |
| MDIX_DIS | E13 | I/O$_{PD}$ | – | **HP Auto-MDIX Disable.**<br>• MDIX_DIS = 0: Automatic TX cable swap detection enabled.<br>• MDIX_DIS = 1: Automatic TX cable swap detection disabled. |
| GIGA0_IFSEL[1]<br>GIGA0_IFSEL[0] | D2<br>F5 | I/O$_{PD}$ | – | **Giga-Port G0 Interface Select.**<br>• GIGA0_IFSEL[1:0] = 11: MII<br>• GIGA0_IFSEL[1:0] = 10: GMII<br>• GIGA0_IFSEL[1:0] = 01: TBI<br>• GIGA0_IFSEL[1:0] = 00: RGMII |
| GIGA1_IFSEL[1]<br>GIGA1_IFSEL[0] | G4<br>D1 | I/O$_{PD}$ | – | **Giga-Port G1 Interface Select.**<br>• GIGA1_IFSEL[1:0] = 11: MII<br>• GIGA1_IFSEL[1:0] = 10: GMII<br>• GIGA0_IFSEL[1:0] = 01: TBI<br>• GIGA1_IFSEL[1:0] = 00: RGMII |
| PHY_POLL_DIS | B1 | I/O$_{PD}$ | – | **PHY Polling Disable.**<br>• Disable External PHY Polling = 1<br>• Enable External PHY Polling = 0 |

*Table 43:  Hardware Signal Definitions  (Cont.)*

| Signal Name | Ball # | Type | Drive (mA) | Description |
|---|---|---|---|---|
| **Voltage Regulator** | | | | |
| VREGCTL1_2<br>VREGSEN1_2<br><br>VREGCTL2_5<br>VREGSEN2_5 | V2<br>W1<br><br>P4<br>R3 | PWR | – | **Low Voltage Regulator Controls.** The BCM53242M incorporates two internal low voltage regulators that can be used in conjunction with the external PNP transistor current driver to supply 1.2V and 2.5V. See "Internal Voltage Regulators" on page 130 for schematic.<br>• The VREGCTL* must be connected to the base of the PNP.<br>• Regulator output sense VREGSEN* must be connected to the collector of the PNP.<br>• The emitter of the PNP must be connected to VREGAVDD and VREGAVDDIO. |
| VREGAVDDIO1_2 | T4 | PWR | – | **1.2V Internal Regulator IO VDD.** This pin must be supplied with a 2.5V external source. |
| VREGAVDD1_2 | U3 | PWR | – | **1.2V Internal Regulator VDD.** This pin must be supplied with a 2.5V external source. |
| REGAGND1_2 | T3 | GND | – | **GND.** |
| VREGAVDDIO2_5 | U2 | PWR | – | **2.5V Internal Regulator IO VDD.** This pin must be supplied with a 3.3V external source. |
| VREGAVDD2_5 | V1 | PWR | – | **2.5V Internal Regulator VDD.** This pin must be supplied with a 3.3V external source. |
| REGAGND2_5 | T2 | GND | – | **GND.** |
| **Power** | | | | |
| VDDO0 | G14, G15, H15, J15 | PWR | – | **VDDO0.** Gigabit 0 interface supply (voltage depends on the interface configuration):<br>• GMII = 3.3V<br>• RGMII = 2.5V<br>• MII = 2.5V or 3.3V<br>• TBI = 3.3V |
| VDDO1 | G11, G12, G13 | PWR | – | **VDDO0.** Gigabit 1 interface supply (voltage depends on the interface configuration):<br>• GMII = 3.3V<br>• RGMII = 2.5V<br>• MII = 2.5V or 3.3V<br>• TBI = 3.3V |
| VDDO2 | G6, G7, G8, G9, G10, H6, J6, K6, L6, M6, T17 | PWR | – | **2.5V Digital I/O voltage** |
| VDDO3 | N6, P6, R4, U1 | PWR | – | **3.3V if 2.5V regulator is used**<br>2.5V if regulator is not used. |
| BIASVDD | W11, T18, P17 | PWR | – | **2.5V Bias Circuit VDD.** |

*Table 43: Hardware Signal Definitions (Cont.)*

| Signal Name | Ball # | Type | Drive (mA) | Description |

# Section 7: BCM53242M Ball Locations

## 400-PBGA Ball Location Diagram

**Figure 41:  400-PBGA Ball Location Diagram (Top View)**

# Section 8: Register Definitions

## Register Notations

In the register description tables, the following notation in the R/W column is used to describe the ability to read or write:

- R/W = Read or write
- RO = Read only
- LH = Latched high. Clear after read operation
- LL = Latched low. Clear after read operation
- H = Fixed high
- L = Fixed low
- SC = Self clear after read

Reserved bits must be written as the default value and ignored when read.

## Register Definition

The BCM532XX series consists of several devices with differing port configurations. Except as noted in Table 46, all switching features are identical within each of the devices. The register definition described hereunder is in the highest port count configuration. Refer to Table 46 for the valid port configuration and feature difference for the specific device.

*Table 46:  Valid Port Map and Feature Difference*

| Device | FE Ports | GE Ports | CFP Rules | MAC-Based QoS/VLAN | Protocol-Based QoS/VLAN | QinQ | VLAN Translation |
|---|---|---|---|---|---|---|---|
| BCM53242M | P0 ~ P23 | G0, G1 | 1K | Y | Y | Y | Y |
| BCM53242S | P0 ~ P23 | G0, G1 | 512 | N | N | N | N |
| BCM53212M | P0 ~ P15 | G0, G1 | 1K | Y | Y | Y | Y |
| BCM53212S | P0 ~ P15 | G0, G1 | 512 | N | N | N | N |
| BCM53202M | P0 ~ P7 | G0, G1 | 1K | Y | Y | Y | Y |
| BCM53202S | P0 ~ P7 | G0, G1 | 512 | N | N | N | N |
| BCM53201M | P0 ~ P4 | G0, G1 | 1K | Y | Y | Y | Y |

The BCM53242M's registers set can be accessed through the SPI Port. The register space is organized into pages, each contains a certain set of registers. The following table lists the pages defined in the BCM53242M. In addition to access via the SPI port, registers can be accessed via the MDC/MDIO path via pseudo MII mode. The per-port MII registers are still accessible via the MDC/MDIO path of the external MII, compatible with the BCM53xx device mode.

To access a page, the page register (0xFF) is written with the page value. The registers contained in the page can then be accessed by their address.

# Global Management Configuration Register (Page 03h/Addr 00h)

*Table 98:  Global Management Configuration Register (Page 03h: Address 00h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | FRM_MNGT_PORT | R/W | Frame Management Port.<br><br>Defines the physical port used to forward management frames directed to the switch.<br>• 00 = No Management Port<br>• 01 = Reserved<br>• 10 = IMP (In-band Management Port)<br>• 11 = Reserved<br><br>These bits are ignored when SW_FWD_MODE = 0 (unmanaged) in the Switch Mode register Page 00h, Address 00h. | 00 |
| 5 | RSVD | RO | Reserved<br>Write default. Ignore on read | 0 |
| 4:3 | IGMP_MLD_CHK | R/W | • 11 = IGMP/MLD snooping is enabled. IGMP/MLD packet is forwarded according to its original port forwarding map from DA/VID look-up in addition to IMP port.<br>• 01 = IGMP/MLD snooping is enabled. IGMP/MLD packet is forwarded to IMP port only.<br>• 00 = IGMP/MLD snooping is disabled. | 0 |
| 2 | RSVD | RO | Reserved<br>Write default. Ignore on read | 0 |
| 1 | RX_BPDU_EN | R/W | Receive BPDU Enable.<br>Enables all ports to receive BPDUs and forward to the defined Physical Management Port. Management CPU must set this bit to globally allow BPDUs to be received. | 0 |
| 0 | RSVD | – | Reserved | 0 |

# Table Memory Reset Control Register (Page 03h/Addr 01h)

*Table 99:  Table Memory Reset Control Register (Page 03h/Addr 01h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:5 | RSVD | R/W | Reserved | 00 |
| 4 | RST_MSPT | SC | Reset Multiple Spanning Tree Table<br>Setting bit = 1 sets the table content to zero, and the bit resets to 0 when the operation is done. | 0 |
| 3 | RST_IPMC | SC | Reset L2 Multicast Table<br>Setting bit = 1 sets the table content to zero, and the bit resets to 0 when the operation is done. | 0 |

*Table 99:  Table Memory Reset Control Register (Page 03h/Addr 01h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 2 | RST_VT | SC | Reset VLAN Table | 0 |
| | | | Setting bit = 1 sets the table content to zero, and the bit resets to 0 when the operation is done. | |
| 1 | RST_ARL | SC | Reset ARL Table | 0 |
| | | | Setting bit = 1 sets the table content to zero, and the bit resets to 0 when the operation is done. | |
| 0 | RST_MIB_CNTR | SC | Reset MIB counters | 0 |
| | | | Setting bit = 1 sets the table content to zero, and the bit resets to 0 when the operation is done. | |

# Management Port ID Register (Page 03h/Addr 02h)

*Table 100:  Management Port ID Register (Page 03h: Address 02h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | RSVD | RO | Reserved<br>Write default. Ignore on read | 0 |
| 5:0 | PORT ID | R/W | Port ID where Management Port is located. This must be programmed consistent with the Frame Management Port in the Global Management Configuration register.<br>*Note:* Only IMP port (Port 48 [30h]) is legal value (i.e., not to be set to any other value). | 0x30 |

# Reset Table Memory Register (Page 03h: Address 03h)

*Table 101:  Reset Table Memory Register (Page 03h: Address 03h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | RSVD | – | Reserved | 0 |
| 5:0 | RST_TBL_MEM | SC | When the corresponding bit is set, the table memory is reset.<br><br>• Bit 5: Resets the port-based egress rate control configuration memory<br>• Bit 4: Resets the port-based ingress rate control configuration memory<br>• Bit 3: Resets the Flow-based VLAN table<br>• Bit 2: Resets the Protocol-based VLAN table<br>• Bit 1: Resets the MAC-based VLAN table<br>• Bit 0: Resets the VLAN-based VLAN table | 0 |

# Aging Time Control Register (Page 03h/Addr 04h–07h)

*Table 102:  Aging Time Control Register (Page 03h: Address 04h–07h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 31:20 | RSVD | RO | Reserved<br>Write default. Ignore on read | 0 |
| 19:0 | AGE_TIME | R/W | Specifies the aging time in seconds for dynamically learned address. Maximum age time is 1,048,575s.<br><br>*Note:* While 802.1D specifies a range of values of 10–1,000,000s, this register does not enforce this range. Setting the AGE_TIME to 0 disables the aging process. | 0x12C |

# RMON MIB Steering Register (Page 03h/Addr 08h–0Fh)

*Table 103:  RMON MIB Steering Register (Page 03h: Address 08h–0Fh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:51 | RSVD | RO | Reserved<br>Write default. Ignore on read | – |
| 50:24 | OR_RMON_RCV[52:24] | R/W | Override RMON Receive.<br>Forces the RMON packet size "bucket" counters from the normal default of snooping on the receive side of the MAC, to the transmit side. This allows the RMON bucket counters to snoop either transmit or receive, allowing full-duplex MAC support.<br>• Bit 50 = GigaPort G1<br>• Bit 49 = GigaPort G0<br>• Bit 48 = IMP<br>• Bits 47:24 = 10/100 ports [port 23–port 0] | 0 |
| 23:0 | RSVD | – | Reserved | 0 |

# Mirror Capture Control Register (Page 03h/Addr 10h–17h)

*Table 104:  Mirror Capture Control Register (Page 03h: Address 10h–17h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 63 | MIRROR_ENABLE | R/W | Global enable/disable for all mirroring on this chip. <br><br> When reset, mirroring is disabled. <br><br> When set, mirroring is enabled according to ingress and egress control rules, to the port designated as MIRROR_CAPTURE_PORT. | 0 |
| 62 | RSVD | – | Reserved | 1 |
| 61:51 | RSVD | RO | Reserved <br><br> Write default. Ignore on read | 0 |
| 50:24 | MIRROR_CAPTURE_PORT | R/W | Mirror Capture Port. <br><br> Bit mask which identifies the single unique port which is designated as the port to which all ingress and/or egress traffic is mirrored on this chip/system. <br> • Bit 50 = GigaPort G1 <br> • Bit 49 = GigaPort G0 <br> • Bit 48 = IMP <br> • Bits 47:24 = 10/100 ports [port 23–port 0] | 0 |
| 23:0 | RSVD | – | Reserved | 0 |

# Ingress Mirror Control Register (Page 03h/Addr 18h–1Fh)

*Table 105: Ingress Mirror Control Register (Page 03h: Address 18h–1Fh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:62 | IN_MIRROR_FILTER | R/W | Ingress Mirror Filter. | 0 |
| | | | Defines conditions under which frames received on a port that has been selected in the IN_MRROR_MASK[52:24], is compared to in order to determine if they should be forwarded to the MIRROR_CAPTURE_PORT. | |
| | | | • 00 = Mirror all ingress frames | |
| | | | • 01 = Mirror all received frames with DA = IN_MIRROR_MAC | |
| | | | • 10 = Mirror all received frames with SA = IN_MIRROR_MAC | |
| | | | • 11 = Reserved. | |
| 61 | IN_DIV_EN | R/W | Ingress Divider Enable. | 0 |
| | | | Mirror every $n^{th}$ received frame (n=IN_MIRROR_DIV, defined in Register Page 03h, Address 20h) that has passed through the IN_MIRROR_FILTER. | |
| 60:51 | RSVD | RO | Reserved | 0 |
| | | | Write default. Ignore on read | |
| 50:24 | IN_MIRROR_MASK[50:24] | R/W | Ingress Mirror Port Mask. | 0 |
| | | | A 27-bit mask which selectively allows any port with its corresponding bit set, to be mirrored to the port identified by the MIRROR_CAPTURE_PORT value. | |
| | | | *Note:* While multiple bits in a device may be set, severe congestion and/or frame loss may occur if excessive bandwidth from the mirrored port(s) is directed to the MIRROR_CAPTURE_PORT. | |
| | | | • Bit 50 = GigaPort G1 | |
| | | | • Bit 49 = GigaPort G0 | |
| | | | • Bit 48 = IMP | |
| | | | • Bits 47:24 = 10/100 ports [port 23–port 0] | |
| 23:0 | RSVD | – | Reserved | 0 |

# Ingress Mirror Divider Register (Page 03h/Addr 20h–21h)

*Table 106: Ingress Mirror Divider Register (Page 03h: Address 20h–21h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:10 | RSVD | RO | Reserved | 0 |
| | | | Write default. Ignore on read | |

*Table 106: Ingress Mirror Divider Register (Page 03h: Address 20h–21h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 9:0 | IN_MIRROR_DIV | R/W | Ingress Mirror Divider. | 0 |
| | | | Receive frames that have passed the IN_MIRROR_FILTER rule can further reduce the overall number of frames forwarded to the MIRROR_CAPTURE_PORT to avoid the congestion. When the IN_DIV_EN bit in the Ingress Mirror Control register is set, only one in n frames is mirrored. | |
| | | | *Note:* Where n = IN_MIRROR_DIV and n must not be set to 0. | |

# Ingress Mirror MAC Address Register (Page 03h/Addr 22h–27h)

*Table 107: Ingress Mirror MAC Address Register (Page 03h: Address 22h–27h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 47:0 | IN_MIRROR_MAC | R/W | Ingress Mirror MAC Address. | 0 |
| | | | MAC address that is compared against ingress frames in accordance with the IN_MIRROR_FILTER rules in Register Page 03h, Address 18h. | |

# Egress Mirror Control Register (Page 03h/Addr 28h–2Fh)

*Table 108:  Egress Mirror Control Register (Page 03h: Address 28h–2Fh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:62 | OUT_MIRROR_FILTER | R/W | Egress Mirror Filter.<br>Defines the type of Egress frames to be mirrored.<br>• 00: Mirror all egress frames<br>• 01: Mirror all transmitted frames with DA = OUT_MIROR_MAC<br>• 10: Mirror all transmitted frames with SA = OUT_MIRROR_MAC<br>• 11: Reserved. | 0 |
| 61 | OUT_DIV_EN | R/W | Egress Divider Enable.<br>Mirror every nth transmitted frame (n=OUT_MIRROR_DIV) that has passed through the OUT_MIRROR_FILTER. | 0 |
| 60:51 | RSVD | RO | Reserved<br>Write default. Ignore on read | 0 |
| 50:24 | OUT_MIRROR_MASK[50:24] | R/W | Egress Mirror Port Mask is to select the port(s) Egress traffic be forwarded to the MIRROR_CAPTURE_PORT.<br>A 27-bit mask which selectively allows any port with its corresponding bit set, to be mirrored to the port identified by the MIRROR_CAPTURE_PORT value.<br>*Note:* While multiple bits in a device may be set, severe congestion and/or frame loss may occur if excessive bandwidth from the mirrored port(s) is directed to the MIRROR_CAPTURE_PORT.<br>• Bit 50 = GigaPort G1<br>• Bit 49 = GigaPort G0<br>• Bit 48 = IMP<br>• Bits 47:24 = 10/100 ports [port 23–port 0] | 0 |
| 23:0 | RSVD | – | Reserved | – |

# Egress Mirror Divider Register (Page 03h/Addr 30h–31h)

*Table 109:  Egress Mirror Divider Register (Page 03h: Address 30h–31h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:10 | RSVD | RO | Reserved<br>Write default. Ignore on read | 0 |
| 9:0 | OUT_MIRROR_DIV | R/W | Egress Mirror Divider.<br>Transmit frames that have passed the OUT_MIRROR_FILTER rule can further reduced the overall number of frames forwarded to the MIRROR_CAPTURE_PORT to avoid the congestion. When the OUT_DIV_EN bit in the Egress Mirror Control register is set, only one in n frames is mirrored.<br>*Note:* Where n = OUT_MIRROR_DIV and n must not be set to 0. | 0 |

# Egress Mirror MAC Address Register (Page 03h/Addr 32h–37h)

*Table 110:  Egress Mirror MAC Address Register (Page 03h: Address 32h–37h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 47:0 | OUT_MIRROR_MAC | R/W | Egress Mirror MAC Address.<br>MAC address that is compared against egress frames in accordance with the OUT_MIRROR_FILTER rules. | 0 |

# Special Management Control Register (Page 03h/Addr 40h)

*Table 111:  Special Management Control Register (Page 03h: Address 40h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | RSVD | – | Reserved | 10 |
| 5 | EN_ARP_CONTROL | R/W | ARP Frame Control.<br>• 0 = ARP frames are flooded in the defined VLAN domain, but are not forwarded to IMP if the IMP does not belong to the same VLAN.<br>• 1 = ARP frames are flooded in the defined VLAN domain and also copied to the IMP even if the IMP is not part of the same VLAN group. | 0 |
| 4 | BYPASS_SPT_CHK | R/W | When this bit is set, incoming packet with DA= 01-80-c2-00-00-00 ~ 01-80-c2-00-00-10 bypasses spanning tree state checking. | 0 |
| 3 | En_ALL_Zero_DA_Drop | R/W | Drop All 0 MAC DA Frame Control.<br>When set, any frame with MAC DA = 00:00:00:00:00:00 is dropped otherwise it is forwarded as is. | 0 |
| 2 | RSVD | R/W | Write as default. Ignore on read. | 0 |
| 1 | PASS_ARP_DHCP | R/W | Enable to Pass ARP and DHCP frames.<br>When management mode is enabled, and if bit 2, RX_BCST_EN (Page 01h/Addr A0h) is disabled, set this bit to 1 to allow the receiving of ARP and DHCP packets. | 0 |
| 0 | PASS_BPDU/Rsvd-MCAST | R/W | Enable to Pass BPDU and Reserved Multicast Frames.<br>Setting this bit allows any port in spanning tree Disable state to forward BPDU and reserved multicast frames within range 01:80:C2:00:00:02 through 01:80:C2:00:00:0F to the IMP port. | 0 |

# MIB Snapshot Control Register (Page 03h/Addr 50h)

*Table 112:  MIB Snapshot Control Register (Page 03h: Address 50h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 7 | SNAPSHOT_START/DONE | R/W (SC) | Snapshot Start/Done Command. When enabled, this bit is self clear to indicate that the process is completed and the snapshot is ready at Table : "Page 85h: Snapshot Port MIB Registers," on page 338. • 1 = Initiate MIB Snapshot function. • 0 = Snapshot function completed. | 0 |
| 6 | SNAPSHOT_MIRROR | RO | 1 = enable read address to port MIB from MIB snapshot memory  0 = enable to read from port MIB memory | 0 |
| 5:0 | SNAPSHOT_PORT | RO | MIB Snapshot Port Number. These bits specify the port number to snapshot. • 50 = GigaPort G1 • 49 = GigaPort G0 • 48 = IMP • 24~47 = 10/100 ports [port 0-port 23] • 0 ~ 23 = Reserved | 0 |

# Ingress RMON Register (Page 03h/Addr 60h–67h)

*Table 113: Ingress RMON Register (Page 03h: Address 60h–67h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:60 | INGRESS_CFG | R/W | Ingress RMON Setting.<br>An exponential value indicating the percentage of traffic that is forwarded to CPU due to Ingress Extended RMON.<br>Percentage = $1/(2^{INGRESS\_CFG})$ | Fh |
| 59:58 | INGRESS_PRI | R/W | Ingress RMON Priority<br>Define which priority queue to use for Ingress Extended RMON.<br>• 11 = Queue 3<br>• 10 = Queue 2<br>• 01 = Queue 1<br>• 00 = Queue 0 | 0 |
| 57:51 | RSVD | RO | Reserved<br>Write default. Ignore on read | 0 |
| 50:24 | EN_INGRESS_PORTMAP | R/W | Ingress RMON Enabled Port Map.<br>A 27-bit mask which selectively allows any port with its corresponding bit set, to enable Ingress Extended RMON.<br>***Note:*** Bit 48 is reserved and must be set to 0.<br>• Bit 50 = GigaPort G1<br>• Bit 49 = GigaPort G0<br>• Bit 48 = Reserved. Must be 0.<br>• Bits 47:24 = 10/100 ports [port 23–port 0] | 0 |
| 23:0 | RSVD | – | Reserved | 0 |

# Egress RMON Register (Page 03h/Addr 68h–69h)

*Table 114:  Egress RMON Register (Page 03h: Address 68h–69h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:12 | EGRESS_CFG | R/W | Egress RMON Setting. An exponential value indicating the percentage of traffic that is forwarded to CPU due to Ingress Extended RMON. Percentage = $1/(2^{EGRESS\_CFG})$ | Fh |
| 11:10 | EGRESS_PRI | R/W | Egress RMON Priority. Define which priority queue to use for Egress Extended RMON. <br>• 11 = Queue 3 <br>• 10 = Queue 2 <br>• 01 = Queue 1 <br>• 00 = Queue 0 | 0 |
| 9:7 | RSVD | RO | Reserved. Write default. Ignore on read | 0 |
| 6 | EN_EGRESS_RMON | R/W | Enable Egress RMON <br>• 1 = Enable <br>• 0 = Disable | 0 |
| 5:0 | EGRESS_RMON_PORT | R/W | Egress RMON Port. Define which port is Egress RMON Port. <br>• 50 = GigaPort G1 <br>• 49 = GigaPort G0 <br>• 48 = IMP <br>• 24~47 = 10/100 ports [port 0-port 23] <br>• 0 ~ 23 = Reserved | 0 |

# Chip Reset Control Register (Page 03h/Addr 7Ch)

*Table 115:  Chip Reset Control Register (Page 03h: Address 7Ch)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:1 | RSVD | RO | Reserved. Write default. Ignore on read | 0 |
| 0 | RST_CHIP | R/W (SC) | Reset Chip. <br>• 1 = Reset the entire chip. <br>• 0 = Resume normal operation <br>***Note:*** This bit is self clear | 0 |

# ARL Read/Write Control Register (Page 05h/Addr 00h)

*Table 124: ARL Read/Write Control Register (Page 05h: Address 00h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7 | START/DONE | R/W (SC) | Start/Done Command. Write as 1 to initiate a read or write command after first loading the MAC_ADDR_INDX register with the MAC address for which the ARL entry is to be read or written. The BCM53242M resets the bit to indicate that a write or read operation has completed, and data from the bin entry is available in ARL Entry. | 0 |
| 6:4 | Reserved | RO | Reserved. Write default. Ignore on read. | 0 |
| 3:1 | TBL_INDEX | R/W | Index to Tables • 111= Flow to VLAN Table • 110 = Protocol to VLAN Table • 101 = MAC to VLAN Table • 100 = VLAN to VLAN Table • 011 = Multiple Spanning Tree Table • 010 = Multicast Table • 001 = VLAN Table • 000 = ARL Table | 0 |
| 0 | TBL_R/W | R/W | Table Read/Write. • 1 = Read. • 0 = Write. | 0 |

# MAC Address Index Register (Page 05h/Addr 02h–07h)

*Table 125: MAC Address Index Register (Page 05h: Address 02h–07h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 47:0 | MAC_ADDR_INDX | R/W | MAC Address Index. The MAC address for which status is to be read or written. By writing the 48 bit SA or DA address, and initiating a read command, the complete ARL bin location is returned in the ARL Entry location. The entry is 64 bits wide. Initiating a write command writes the contents of ARL Entry to the specified bin location and overwrites the current contents of the bin, regardless of the Valid bit status in each entry. ***Note:*** MAC_ADDR_INDX is also used as the index to the MAC to VLAN table. | 00-00-00-00-00-00h |

## VID Table Index Register (Page 05h/Addr 08h–09h)

*Table 126: VID Table Index Register (Page 05h: Address 08h–09h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:12 | Reserved | RO | Reserved.<br>Write default. Ignore on read. | 0 |
| 11:0 | VID_TBL_INDX | R/W | VLAN Table Index.<br>When 802.1Q is enabled and VID_MAC Control, bits[6:5] of 802.1Q VLAN Control 0 register are asserted (Page 34h, Addr 00h), VID_TBL_INDX is used with the MAC_ADDR_INDX, defined in the MAC Address Index register, to form the hash index for which status is to be read or written. | 000h |

## ARL Entry 0 Register, for Unicast Address (Page 05h/Addr 10h–17h)

*Table 127: ARL Entry 0 Register, for Unicast Address Register (Page 05h: Address 10h–17h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63 | VALID | R/W | Valid.<br>Set to indicate that a valid MAC address is stored in the MACADDR field, and that the entry has not aged out or been freed by the management processor.<br>Reset when an entry is empty, the address has been aged out by the internal aging process, or the external management processor has invalidated the entry. Automatic learning takes place if an address location is not valid and has not been marked as static. | 0 |
| 62 | STATIC | R/W | Static.<br>Set to indicate that the entry is controlled by the external management processor, and automatic learning and aging of the entry does not take place.<br>When cleared, the internal learning and aging process controls the validity of the entry. | 0 |
| 61:60 | CON[1:0] | R/W | ARL mode control.<br>These bits select the ARL mode, which determines the forwarding decision.<br>• 11 = Forward to destination port specified by ARL and also send to IMP. (Suggest to also set bit 62).<br>• 10 = Drop if MAC_SA match. (Suggest to also set bit 62).<br>• 01 = Drop if MAC_DA match. (Suggest to also set bit 62).<br>• 00 = Normal ARL function. Forward to destination port specified by ARL. | 0 |

*Table 127: ARL Entry 0 Register, for Unicast Address Register (Page 05h: Address 10h–17h) (Cont.)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 59 | AGE0 | R/W | Age | 0 |
| | | | Set to indicate that an address entry has been learned or accessed. Reset by the internal aging algorithm. If the internal aging process detects a Valid entry has remained unused for the period set by the AGE_TIME, and the entry has not been marked as Static, the entry has the Valid bit cleared. The Age bit is ignored if the entry has been marked as Static. | |
| 58:54 | Reserved | R/W | Write as default. Ignore on read | 0 |
| 53:48 | PORTID[5:0] | R/W | Port Identification (for unicast address) | 0 |
| | | | The port number which identifies where the station with unique MACADDR is connected. | |
| | | | • 50 = GigaPort G1 | |
| | | | • 49 = GigaPort G0 | |
| | | | • 48 = IMP | |
| | | | • 24 ~ 47 = 10/100 ports [port 0–port 23] | |
| | | | • 0 ~ 23 = Reserved | |
| 47:0 | MACADDR | R/W | MAC Address | 0 |

## ARL Entry 0 Register, for Multicast Address (Page 05h/Addr 10h–17h)

*Table 128: ARL Entry, for Multicast Address Register (Page 05h: Address 10h–17h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63 | VALID | R/W | Valid. | 0 |
| | | | Set to indicate that a valid MAC address is stored in the MACADDR field, and that the entry has not aged out or been freed by the management processor. | |
| | | | Reset when an entry is empty, the address has been aged out by the internal aging process, or the external management\processor has invalidated the entry. Automatic learning takes place if an address location is not valid and has not been marked as static. | |
| 62 | STATIC | R/W | Static. | 0 |
| | | | Set to indicate that the entry is controlled by the external management processor, and automatic learning and aging of the entry does not take place. | |
| | | | When cleared, the internal learning and aging process controls the validity of the entry. | |

*Table 128: ARL Entry, for Multicast Address Register (Page 05h: Address 10h–17h) (Cont.)*

|-----|------|-----|-------------|---------|
| 7 | START/DONE | R/W (SC) | Start/Done Command.<br><br>Write as 1 to initiate a sequential search of the ARL entries, returning each entry that is currently occupied (Valid = 1 and AGE = 0) in the ARL Search Result register. Reading the ARL Search Result register causes the ARL search to continue.<br>The BCM53242M clears this bit to indicate the entire ARL entry database has been searched. | 0 |
| 6:1 | RSVD | RO | Reserved.<br><br>Write default. Ignore on read. | 0 |
| 0 | ARL_SR_VALID | RC | ARL Search Result Valid.<br><br>Set by the BCM53242M to indicate that an ARL entry is available in the ARL Search Result register.<br><br>Reset by a host read to the ARL Search Result register, which causes the ARL search process to continue through the ARL entries until the next entry is found with a Valid bit is set. | 0 |

# ARL Search Address Register (Page 05h/Addr 52h–53h)

*Table 138:  ARL Search Address Register (Page 05h: Address 52h–53h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | ARL_ADDR_VALID | R/W (SC) | ARL Address Valid.<br><br>Indicates the lower 15 bits of this register contain a valid internal representation of the ARL entry currently being accessed. | 0 |
| 14:13 | RSVD | RO | Reserved.<br><br>Write default. Ignore on read. | 0 |
| 12:0 | ARL_ADDR | R/W | ARL Address.<br><br>15-bit internal representation of the address of the ARL entry currently being accessed by the ARL search routine. This is not a direct address of the ARL location. | 0 |

# ARL Search Result MAC Register (Page 05h/Addr 54h–5Bh)

*Table 139: ARL Search Result Register (Page 05h: Address 54h–5Bh)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 63 | VALID | RO | Valid. | 0 |
| | | | Set to indicate that a valid MAC address is stored in the MACADDR field, and that the entry has not aged out or been freed by the management processor. | |
| | | | All entries returned by the ARL Search process has the VALID bit set. | |
| 62 | STATIC | RO | Static. | 0 |
| | | | Set to indicate that the entry is controlled by the external management processor, and automatic learning and aging of the entry does not take place. | |
| | | | When cleared, the internal learning and aging process controls the validity of the entry. | |
| | | | All entries with STATIC bit set are returned by the ARL Search process. | |
| 61:60 | CON[1:0] | RO | ARL mode control. | 0 |
| | | | These bits select the ARL mode, which determines the forwarding decision. | |
| | | | • 11 = Forward to destination port specified by ARL and also send to IMP. (Suggest to also set bit 62). | |
| | | | • 10 = Drop if MAC_SA match. (Suggest to also set bit 62). | |
| | | | • 01 = Drop if MAC_DA match. (Suggest to also set bit 62). | |
| | | | • 00 = Normal ARL function. Forward to destination port specified by ARL. | |
| 59 | AGE | RO | Age. | 0 |
| | | | Set to indicate that an address entry has been learned or accessed. | |
| | | | Reset by the internal aging algorithm. If the internal aging process detects a Valid entry has remained unused for the period set by the AGE_TIME, and the entry has not been marked as Static, the entry has the AGE bit cleared. | |
| | | | The Age bit is ignored if the entry has been marked as Static. | |
| 58:54 | RSVD | RO | Reserved. | 0 |
| | | | Write default. Ignore on read. | |
| 53:48 | PORTID[5:0] | RO | Port Identification. | 0 |
| | | | The port number which identifies where the station with unique MACADDR is connected. | |
| | | | • 50 = GigaPort G1 | |
| | | | • 49 = GigaPort G0 | |
| | | | • 48 = IMP | |
| | | | • 24 ~ 47 = 10/100 ports [port 0–port 23] | |
| | | | • 0 ~ 23 = Reserved | |
| 47:0 | MACADDR | RO | MAC Address. | 0 |
| | | | The unique MAC address of the station occupying this ARL entry. | |

# ARL Search Result VID Register (Page 05h/Addr 5Ch–5Dh)

*Table 140:  ARL Search Result VID Register (Page 05h: Address 5Ch–5Dh)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 15 | RSVD | RO | Reserved. Write default. Ignore on read. | 0 |
| 14:12 | USER_DEF | RO | User Defined Field These are user defined bits. These bits are also written into the ARL table along with ARL_VID_ENTRY. | 0 |
| 11:0 | VID | RO | VID search result. | 0 |

**Note:** If 802.1Q is enables, Broadcom recommends to read the ARL Search Result VID register first, then read the ARL Search Result MAC register.

# Page 0Ah: Priority Queue Control Registers

| 5:0 | Q2_quota_size | R/W | The round robin weight for priority queue 0. | 04h |

*Note:* Maximum Q2_quota_size allowable is 37h.

## Queue 3 100TX Threshold Control 1 Register (Page 0Ah/Addr 86h–87h)

*Table 175:  Queue 3 100TX Threshold Control 1 Register (Page 0Ah: Address 86h–87h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:8 | Q3_BT100_HYST_THRS | R/W | Q3 Unpause Threshold<br><br>Regulates the transmission of the TXQ-based flow control unpause frame. Under mixed-speed mode, when Q0 reaches a pause condition, and the number of pointers queued up in the corresponding TXQ (Q3) drops below this threshold, an unpause frame is dispatched.<br><br>The effective threshold is the default value multiplied by 8. | 13h |
| 7:0 | Q3_BT100_PAUS_THRS | R/W | Q3 Pause Threshold<br><br>Regulates the transmission of the TXQ-based flow control pause frame. Under mixed-speed mode, when the number of pointers queued up in the corresponding TXQ (Q3) exceeds this threshold, a pause frame is dispatched.<br><br>The effective threshold is the default value multiplied by 8. | 1Ch |

## Queue 3 100TX Threshold Control 2 Register (Page 0Ah/Addr 88h–89h)

*Table 176:  Queue 3 100TX Threshold Control 2 Register (Page 0Ah: Address 88h–89h)*

| Bit | Name | R/W | Description | Default | Recommend Value |
|-----|------|-----|-------------|---------|-----------------|
| 15:8 | Q3_BT100_DROP_THRS | R/W | Q3 Unicast Drop Threshold<br><br>Regulates incoming unicast frames. Under mixed- speed mode, when the number of pointers queued up in the corresponding TXQ (Q3) exceeds this threshold, all incoming unicast frames will be dropped.<br><br>The effective threshold is the default value multiplied by 8. | 9Fh | 98 |
| 7:0 | Q3_BT100_MCDROP_THRS | R/W | Q3 Multicast Drop Threshold<br><br>Regulates incoming multicast frames. Under mixed- speed mode, when the number of pointers queued up in the corresponding TXQ (Q3) exceeds this threshold, all incoming multicast frames will be dropped.<br><br>The effective threshold is the default value multiplied by 8. | 9Fh | 73 |

# RX Base Buffer Number Register (Page 0Ah/Addr 8Ah-8Bh)

*Table 177: RX Base Buffer Number Register (Page 0Ah/Addr 8Ah-8Bh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:8 | RXBase_RESV_BUFNUM | RO | The reserved buffer number for each port when the RX base flow control is calculated. No pause/drop action will occur if the buffer number used by a port is less than this register. The effective number is this register value. | 0Fh |
| 7:0 | RXBase_HYST_BUFNUM | R/W | The hyster buffer number for each port when the RX base flow control is calculated. | 14h |

# Queue 3 TxDsc Control Register (Page 0Ah/Addr 8Eh–8Fh)

*Table 178: Queue 3 TxDsc Control Register (Page 0Ah: Address 8Eh–8Fh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:6 | RSVD | RO | Reserved<br>Write default. Ignore on read. | 0 |
| 5:0 | Q3_quota_size | R/W | The round robin weight for priority queue 3. | 08h |

**Note:** Maximum Q3_quota_size allowable is 37h.

# Reserved Buffer Number Register (Page 0Ah/Addr 90h-91h)

*Table 179: Reserved Buffer Number Register (Page 0Ah/Addr 90h-91h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:12 | RSVD | RO | Reserved | 0 |
| 11 | EN_RELOAD_ERR_PATH | R/W | Enable reload error path. | 0 |
| 10 | EN_LCOL_FLUSH | R/W | Enable local collision flush function. | 0 |
| 9 | DIS_NEW_TXDIS | R/W | Disable new tx_disable function. | 0 |
| 8 | EN_2SEC_FLUSH | R/W | Enable two second flush function. | 0 |
| 7:0 | RUNOFF | R/W | Runoff | 13h |

# Received Base Flow Control Register (Page 0Ah/Addr 92h-93h)

*Table 180: Received Base Flow Control Register (Page 0Ah/Addr 92h-93h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | RSVD | RO | Reserved | 0 |
| 14 | SW_ENFDXFLOW | R/W | ***Note:*** SW_ENFDXFLOW is reserved for engineer testing only. | 1 |
| 13 | EN_UNPAUSE_HDL | R/W | Enables pause-cap and pause-uncap handle. | 1 |
| 12 | EN_RX_FCON_PAUSE_ REMAP | R/W | Enables RX base flow control pause threshold remap. Provides more control over commencement of flow control due to RX base scheme. | 0 |
| 11:0 | RX_FCON_PAUSE_THRS | R/W | Allows pause threshold to start flow control. When the available buffer reaches threshold, all the ports use more than the reserved buffer. This forces a pause. The effective number is this register. | 5C0h |

# DLF Threshold Drop Register (Page 0Ah/Addr 94h–95h)

*Table 181: DLF Threshold Drop Register (Page 0Ah: Address 94h–95h)*

| Bit | Name | R/W | Description | Default | Recommended Value |
|-----|------|-----|-------------|---------|-------------------|
| 15:8 | TOTAL_INDV_DLFTH_ DROP | R/W | Total individual DLF drop threshold. Regulates total incoming DLF frames. When EN_DLF_BC_DROP_THRS of "Global Option Control Register (Page 0Ah/ Addr 30h–31h)" on page 237 is asserted, the total incoming DLF frames exceed this threshold are dropped. The effective threshold is the default value multiplied by 8. | B2h | 7E |
| 7:0 | INDV_DLFTH_DROP | R/W | Individual DLF drop threshold. Regulates individual port incoming DLF frames. When EN_DLF_BC_DROP_THRS of "Global Option Control Register (Page 0Ah/ Addr 30h–31h)" on page 237 is asserted, the incoming DLF frames at individual port exceed this threshold are dropped. The effective threshold is the default value multiplied by 8. | 9Fh | – |

## Broadcast Threshold Drop Register (Page 0Ah/Addr 96h–97h)

*Table 182: Broadcast Threshold Drop Register (Page 0Ah: Address 96h–97h)*

| Bit | Name | R/W | Description | Default | Recommended Value |
|-----|------|-----|-------------|---------|-------------------|
| 15:8 | TOTAL_INDV_BCSTTH_DROP | R/W | Total individual broadcast drop threshold. Regulates total incoming Broadcast frames. When EN_DLF_BC_DROP_THRS of "Global Option Control Register (Page 0Ah/Addr 30h–31h)" on page 237 is asserted, the total incoming Broadcast frames exceed this threshold are dropped. The effective threshold is the default value multiplied by 8. | B2h | 7E |
| 7:0 | INDV_BCSTTH_DROP | R/W | Individual broadcast drop threshold. Regulates individual port incoming Broadcast frames. When EN_DLF_BC_DROP_THRS of "Global Option Control Register (Page 0Ah/Addr 30h–31h)" on page 237 is asserted, the incoming Broadcast frames at individual port exceed this threshold are dropped. The effective threshold is the default value multiplied by 8. | 9Fh | – |

## LAN to IMP Unicast Control Register (Page 0Ah/Addr A0h–A1h)

*Table 183: LAN to IMP MC Control 1 Register (Page 0Ah: Address A0h–A1h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | IMP_CONGST_REMAP_EN | R/W | Remap IMP Port Congestion Status<br>• 1 = Remap from PAUSE to DROP | 0 |
| 14:1 | RSVD | RO | Reserved | 0 |
| 0 | REMAP_PAUSE_DROP_EN | R/W | • 1 = Remap PAUSE to DROP<br>• 0 = Remap PAUSE to Hysteresis<br>*Note:* Reserved for internal test only. | 1 |

## LAN to IMP Multicast Control 1 Register (Page 0Ah/Addr A2h–A3h)

*Table 184:  LAN to IMP MC Control 1 Register (Page 0Ah: Address A2h–A3h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 15:1 | RSVD | – | Reserved | 0 |
| 0 | MC_IMP_DROP_EN | R/W | When this bit is set, activates the MC_IMP_DROP_THRSHLD in "LAN to IMP Multicast Control 2 Register (Page 0Ah/Addr A4h–A5h)" on page 249. | 0 |

## LAN to IMP Multicast Control 2 Register (Page 0Ah/Addr A4h–A5h)

*Table 185:  LAN to IMP MC Control 2 Register (Page 0Ah: Address A4h–A5h)*

| Bit | Name | R/W | Description | Default |

## TBI Control Register (Page 0Dh/Addr 00h–01h)

*Table 198: TBI Control Register (Page 0Dh: Address 00h–01h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 15:14 | bypass_10b | R/W | Bypass TBI edcode/encode function.<br>• Bit 14 = GigaPort G0<br>• Bit 15 = GigaPort G1. | 00 |

*Table 198: TBI Control Register (Page 0Dh: Address 00h–01h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 13:12 | sgmii_restart_an[1:0] | R/W | The signal is used to restart SGMII autoneg. Active high and self clear.<br>• Bit 12 = GigaPort G0<br>• Bit 13 = GigaPort G1. | 00 |
| 11:10 | Reserved | RO | | 00 |
| 9:8 | fiber_mode[1:0] | R/W | Enable fiber mode. Active high. Enabling fiber mode affects AutoNeg function. When 1, the autoneg complies with IEEE claus 37 defined AutoNeg, otherwise, it is SGMII Autoneg.<br>• Bit 8 = GigaPort G0.<br>• Bit 9 = GigaPort G1. | 3h |
| 7:6 | mr_hd[1:0] | R/W | AN Half duplex capability. If this bit is set to 1, SerDes AutoNeg advertises half duplex ability. The mr_hd and mr_fd can be set to 1 at the same time to indicate able to support half/full duplex.<br>• Bit 6 = GigaPort G0.<br>• Bit 7 = GigaPort G1. | 00 |
| 5:4 | mr_fd[1:0] | R/W | AN Full duplex capability. If this bit is set to 1, SerDes AutoNeg advertises full duplex ability. The mr_hd and mr_fd can be set to 1 at the same time to indicate able to support half/full duplex.<br>• Bit 4 = GigaPort G0.<br>• Bit 5 = GigaPort G1. | 3h |
| 3:2 | Reserved | RO | | 00 |
| 1:0 | mr_main_reset | R/W | Software reset, height enable (extended to 1.7 µs long internally) | 00 |

# PRBS Control Register (Page 0Dh/Addr 02h)

*Table 199: PRBS Control Register (Page 0Dh: Address 02h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:4 | prbs_order [3:0] | R/W | • 00 = x(n)= 1 + x(6) + x(7)<br>• 01 = x(n)= 1 + x(14) + x(15)<br>• 10 = x(n)= 1 + x(14) + x(15)<br>• 11 = x(n)= 1 + x(28) + x(31)<br>• Bit 3:2 for GigaPort G1<br>• Bit 1:0 for GigaPort G0 | 00 |

*Table 199:  PRBS Control Register (Page 0Dh: Address 02h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 3:2 | prbs_en [1:0] | R/W | Enable PRBS generator, when this bit is enabled, fiber_mode and en10b need to be asserted together because it generates the nonethernet packet.<br>• Bit 0 = GigaPort G0.<br>• Bit 1 = GigaPort G1. | 00 |
| 1:0 | prbs_err_clr[1:0] | R/W | Clear PRBS error counter value.<br>• Bit 0 = GigaPort G0.<br>• Bit 1 = GigaPort G1.<br>This bit is a write and clear bit. | 00 |

## PRBS Status Register (Page 0Dh/Addr 03h–06h)

*Table 200:  PRBS Status Register (Page 0Dh: Address 03h–06h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 31:18 | prbs_errors_p26 [13:0] | RO | Port 26 PRBS error counter | 0000h |
| 17:4 | prbs_errors_p25 [13:0] | RO | Port 25 PRBS error counter | 000h |
| 3:2 | prbs_lock [1:0] | RO | PRBS monitor is locked.<br>• Bit 0 = GigaPort G0.<br>• Bit 1 = GigaPort G1. | 00 |
| 1:0 | prbs_stky[1:0] | RO | PRBS Lost lock sticky bit.<br>• Bit 0 = GigaPort G0.<br>• Bit 1 = GigaPort G1. | 00 |

# MR Status Register (Page 0Dh/Addr 07h)

*Table 201:  MR Status Register (Page 0Dh: Address 07h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | mr_page_rx[1:0] | RO | Reg6.1 to indicate base page received.<br>• Bit 0 = GigaPort G0.<br>• Bit 1 = GigaPort G1. | 00 |
| 5:4 | mr_remote_fault[1:0] | RO | Reg1.4 to indicated remote fault detected.<br>• Bit 0 = GigaPort G0.<br>• Bit 1 = GigaPort G1. | 00 |
| 3:2 | Reserved | RO | | 00 |
| 1:0 | pr_error[1:0] | RO | Priority resolution error used for local device remote fault<br>• Bit 0 = GigaPort G0.<br>• Bit 1 = GigaPort G1. | 00 |

# SGMII Clear Control Register (Page 0Dh/Addr 08h)

*Table 202:  SGMII Clear Control Register (Page 0Dh: Address 08h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:4 | Reserved | RO | | 0 |
| 3:2 | sgmii_status_clear | R/W | This signals is the one to clear SGMII status register once it is read.<br>• Bit 0 = GigaPort G0.<br>• Bit 1 = GigaPort G1.<br>Active low signal. | 11 |
| 1:0 | sgmii_crc16 | RO | This signals is the one to clear CRC16 register once it is read.<br>• Bit 0 = GigaPort G0.<br>• Bit 1 = GigaPort G1.<br>Active low signal. | 11 |

# Gigabit Port SGMII Control Register (Page 0Dh/Addr 50h–53h)

*Table 203:  Gigabit Port SGMII Control Register (Page 0Dh: Address 50h–53h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 15 | force_data_mode | R/W | When 1, synchronization and data valid won't be detected. By setting this bit to 1 and en10b=1, cdet_en=1, user can use GMII to directly send and receive raw TBI data to and from analog SerDes. | 0 |
| 14:13 | Remote Fault[1:0] | R/W | To Set remote fault bits in AutoNeg link code word. This only works when an_sel = 1. | 00 |
| 12:11 | Pause[1:0] | R/W | To Set Pause bits in AutoNeg link code word. This only works when an_sel = 1. | 00 |
| 10 | an_sel | R/W | When 0, select SGMII auto-neg. Otherwise, select IEEE clause 37 complied auto-neg. | 0 |
| 9 | tx_short_latency_en | R/W | • 0 = assert 1-nibble (max) early preamble in 100/10 mode<br>• 1 = No early preamble is asserted | 0 |
| 8 | err_timer_en | R/W | Enable error timer in auto-neg for testability. | 0 |
| 7 | rev_phase | R/W | When 1, latch 10 bit data from analog SerDes by falling edge of clock, otherwise latch data at rising edge of clock. | 0 |
| 6 | Reserved | R/W | – | 0 |
| 5 | short_latency_en | R/W | Enable short latency function that makes RX side start sending preamble when CRS is detected. When this bit is disabled, it only affects speed 1000. This bit is used when user plans to send nonethernet packet. | 0 |
| 4 | cdet_en | R/W | When 1, Disable comma detector. | 0 |
| 3 | an_tst_mode | R/W | Reduce timer for AutoNeg testing. | 0 |
| 2 | sg_an_disable | R/W | When 1, Disable AutoNeg directly to Data Mode. | 0 |
| 1 | remote_lpbk | R/W | Remote loop-back for testability. | 0 |
| 0 | tbi_lpbk | R/W | TBI loop-back for testability. | 0 |

# Gigabit Port SGMII Status Register (Page 0Dh/Addr 54h–57h)

*Table 204: Gigabit Port SGMII Status Register (Page 0Dh: Address 54h–57h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 15 | pr_rx_ps_en | RO | The result of priority resolution to enable PAUSE receive. | 0 |
| 14 | pr_tx_ps_en | RO | The result of priority resolution to enable PAUSE transmit. | 0 |
| 13 | pr_duplex | RO | Priority resolution for duplex indication | 0 |
| 12 | sgmii_enable | RO | SGMII enable indication | 0 |
| 11:8 | r_an_sta_upper | RO | To indicate the highest AN FSM state variable. | 0 |
| 7:4 | r_an_sta_lower | RO | To indicate the lowest AN FSM state variable | 0 |
| 3 | com_det | RO | Indicate comma detected. | 0 |
| 2 | sg_mac_ack | RO | Indicate the MAC acknowledge bit status | 0 |
| 1 | sg_an_complete | RO | To indicate AN complete. | 0 |
| 0 | sg_an_error | RO | To indicate AN error | 0 |

# Gigabit Port Link Partner Link Status Register (Page 0Dh/Addr 58h–5Bh)

*Table 205: Gigabit Port Link Partner Link Status Register (Page 0Dh: Address 58h–5Bh)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 15:0 | mr_lp_adv_ability | RO | Link partner's link code word. In SGMII mode, if mac_mode = : <br>• 0, refer to tx_config_reg[15:0] from MAC to PHY in SGMII Specification <br>• 1, refer to tx_config_reg[15:0] from PHY to MAC in SGMII Specification <br>In fiber mode, the data is from the link partner. | 0000h |

# Gigabit Port CRC16 Register (Page 0Dh/Addr 5Ch–5Fh)

*Table 206: Gigabit Port CRC16 Register (Page 0Dh: Address 5Ch–5Fh)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 15:0 | sgmii_crc16_p | RO | Send 16 bit CRC value. It is cleared by crc16_clear_n or during the preamble in the next packet. Calculation is valid for GMII/MII packets with preamble and SFD | 0000h |

# Page 10h: PHY Info Registers

*Table 207: PHY Info Registers (Page 10h)*

| Address | Bits | Register Name |
|---|---|---|
| 00h–03h | Reserved | |
| 04h–05h | 16 | "PHY ID High Register (Page 10h/Addr 04h)" on page 259 |

|---|---|---|---|---|
| 63:0 | TCAM_MASK5[371:320] | R/W | TCAM Mask for different Opcode<br>For Opcode = 4'b0001<br>• The output of TCAM mask [371:320]<br>For Opcode = 4'b0010<br>• The input of TCAM mask [371:320] | 0 |

# CFP Action Policy Data Register (Page 20h/Addr 70h–75h)

*Table 225: CFP Action Policy Data Register (Page 20h: Address 70h–75h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 47:46 | RSVD | RO | Reserved.<br>Write default. Ignore on read. | 0 |

*Table 225: CFP Action Policy Data Register (Page 20h: Address 70h–75h) (Cont.)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 45 | CHNG_DSCP_OB | R/W | Change DSCP for Out-Band:<br>• 1 = Replace DSCP field of the corresponding packet with New_DSCP_OB<br>• 0 = Ignore New_DSCP_OB content for this policy | 0 |
| 44:39 | NEW_DSCP_OB | R/W | New DSCP value for Out-Band<br>• The value will replace the original DSCP value if CHNG_DSCP_OB is set | 0 |
| 38:37 | CHNG_FWD_OB[1:0] | R/W | Change Forward Map for Out-Band<br>• 00: No change. Forward based on ARL forward map.<br>• 01: Use NEW_FWD_OB[5:0] as final forward map<br>• 10: ARL forward map is ORed with NEW_FWD_OB[5:0] to get the final forward map<br>• 11: Explicit actions (such as switching drop, copy CPU, mirror) are defined by NEW_FWD_OB[5:0] | 0 |

*Table 225: CFP Action Policy Data Register (Page 20h: Address 70h–75h)  (Cont.)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 36:31 | NEW_FWD_OB[5:0] | R/W | New Destination Port Number for Out-Band.<br><br>• When bits[38:37] = 01 or 10, NEW_FWD_OB[5:0] is defined as:<br>   – 0~23 = Reserved<br>   – 24 = Port 0<br>   – ...<br>   – 47 = Port 23<br><br>   – 48 = IMP<br>   – 49 = Giga Port G0<br>   – 50 = Giga Port G1<br>   – 51 ~ 62 = Reserved<br>   – 63 = Flood to all linked-up ports.<br>• When bits[38:37] = 11, NEW_FWD_OB[5:0] defines the new actions:<br>   – 0~55 = Reserved<br>   – 56 = Forward packet based on ARL forward map<br>   – 57 = Forward packet based on ARL and copy to Mirror Capture port<br>   – 58 = Forward packet based on ARL and copy to IMP port<br>   – 59 = Forward packet based on ARL and to both IMP and Mirror Capture ports<br>   – 60 = Drop the packet<br>   – 61 = Forward packet to Mirror Capture port only<br>   – 62 = Forward packet to IMP port only<br>   – 63 = Forward packet to both IMP and Mirror Capture ports. | 0 |
| 30:29 | CHNG_FLOW | | change flow (VID) for In/Out-Band (modify packet)<br>• 11 = use NEW_FLOW_INDX to get VID value on Egress side to swap CVID/SPVID at UNI/NNI port.<br>• 10 = use NEW_FLOW_INDX to get VID value on Egress side to swap SPVID at NNI port<br>• 01 = use NEW_FLOW_INDX to get VID value on Egress side to swap CVID at UNI port<br>• 00 = do not care NEW_FLOW_INDX content for this policy | 0 |
| 28:25 | NEW_FLOW_INDX | | New Flow (VID) index for In/Out-Band | 0 |

*Table 225:  CFP Action Policy Data Register (Page 20h: Address 70h–75h)  (Cont.)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 24 | CHNG_DSCP_IB | | Change DSCP for In-Band.(modify packet) | 0 |
| | | | • 1 = will change DSCP field of the corresponding packet | |
| | | | • 0 = Don't care New_DSCP_IB content for this policy | |
| 23:18 | NEW_DSCP_IB | | New DSCP value for In-Band | 0 |
| | | | The value will replace the original DSCP value if CHNG_DSCP_IB is set | |
| 17 | CHNG_PCP | | Change 802.1p header for In/Out-Band | 0 |
| | | | • 1 = Replace 802.1p field of the corresponding packet with NEW_PCP | |
| | | | • 0 = Ignore New_PCP content for this policy | |
| 16:14 | NEW_PCP | RO | New 802.1p header for In/Out-Band | 0 |
| | | | This value will replace the original 802.1p tag if CHNG_PCP is set. | |
| 13 | CHNG_QOS | R/W | Update Priority for In/Out-Band. | 0 |
| | | | • 1 = Replace the priority of the corresponding frame with NEW_QOS. | |
| | | | • 0 = Ignore NEW_QOS content for this policy. | |
| 12:11 | NEW_QOS | RO | Priority map for In/Out-Band (Ethernet port only) | 0 |
| | | | The priority to be changed to if CHNG_QOS is set | |
| 10 | CHNG_QOS_IMP | R/W | Change QoS for In/Out-Band (IMP port only, do not modify packet) | 0 |
| | | | • 1 = Replace the priority of the corresponding frame with NEW_QOS_IMP. | |
| | | | • 0 = Ignore NEW_QOS_IMP content for this policy. | |
| 9:8 | NEW_QOS_IMP | R/W | Priority Map for In/Out-Band (IMP port only) | 0 |
| | | | The priority to be changed to if CHG_QOS_IMP is asserted. | |
| 7:6 | CHNG_FWD_IB[1:0] | R/W | Change Forward Map for In-Band | 0 |
| | | | • 00: Forward based on ARL forward map with no change | |
| | | | • 01: Use NEW_FWD_IB[5:0] as final forward map. | |
| | | | • 10: ARL forward map is ORed with NEW_FWD_IB[5:0] to get the final forward map | |
| | | | • 11: Explicit actions (such as switching drop, copy CPU, mirror) are defined by NEW_FWD_IB[5:0] | |

*Table 225: CFP Action Policy Data Register (Page 20h: Address 70h–75h) (Cont.)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 5:0 | NEW_FWD_IB[5:0] | R/W | New Destination Port Number for In-Band. <br>• When bits[38:37] = 01 or 10, NEW_FWD_IB[5:0] is defined as: <br>  – 0~23 = Reserved <br>  – 24 = Port 0 <br>  – ... <br>  – 47 = Port 23 <br>  – <br>  – 48 = IMP <br>  – 49 = Giga Port G0 <br>  – 50 = Giga Port G1 <br>  – 51 ~ 62 = Reserved <br>  – 63 = Flood to all linked-up ports. <br>• When bits[38:37] = 11, NEW_FWD_IB[5:0] defines the new actions: <br>  – 0~55 = Reserved <br>  – 56 = Forward packet based on ARL forward map <br>  – 57 = Forward packet based on ARL and copy to Mirror Capture port <br>  – 58 = Forward packet based on ARL and copy to IMP port <br>  – 59 = Forward packet based on ARL and to both IMP and Mirror Capture ports <br>  – 60 = Drop the packet <br>  – 61 = Forward packet to Mirror Capture port only <br>  – 62 = Forward packet to IMP port only <br>  – 63 = Forward packet to both IMP and Mirror Capture ports. | 0 |

# CFP Rate Meter Configuration Register (Page 20h/Addr 80h–83h)

*Table 226: CFP Rate Meter Configuration Register (Page 20h: Address 80h–83h)*

| Bit | Name | R/W | Description | Default |

# CFP UDF A0 Control Register (Page 22h/Addr 00h)

*Table 244:  CFP UDF A0 Control Register (Page 22h: Address 00h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_A0 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_A0 | R/W | The offset used for UDF_A0 which is used in Slice 0. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF A1 Control Register (Page 22h/Addr 01h)

*Table 245:  CFP UDF A1 Control Register (Page 22h: Address 01h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_A1 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_A1 | R/W | The offset used for UDF_A1 which is used in Slice 0. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF A2 Control Register (Page 22h/Addr 02h)

*Table 246:  CFP UDF A2 Control Register (Page 22h: Address 02h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_A2 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_A2 | R/W | The offset used for UDF_A2 which is used in Slice 0. The number counts from the reference port of frame. Rx port extracts 16 bits data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF B0 Control Register (Page 22h/Addr 10h)

*Table 247: CFP UDF B0 Control Register (Page 22h: Address 10h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 7:6 | UDF_REF_B0 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_B0 | R/W | The offset used for UDF_B0 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF B1 Control Register (Page 22h/Addr 11h)

*Table 248: CFP UDF B1 Control Register (Page 22h: Address 11h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 7:6 | UDF_REF_B1 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_B1 | R/W | The offset used for UDF_B1 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF B2 Control Register (Page 22h/Addr 12h)

*Table 249: CFP UDF B2 Control Register (Page 22h: Address 12h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 7:6 | UDF_REF_B2 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |

*Table 249:  CFP UDF B2 Control Register (Page 22h: Address 12h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 5:0 | UDF_OFFSET_B2 | R/W | The offset used for UDF_B2 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF B3 Control Register (Page 22h/Addr 13h)

*Table 250:  CFP UDF B3 Control Register (Page 22h: Address 13h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_B3 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_B3 | R/W | The offset used for UDF_B3 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF B4 Control Register (Page 22h/Addr 14h)

*Table 251:  CFP UDF B4 Control Register (Page 22h: Address 14h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_B4 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_B4 | R/W | The offset used for UDF_B4 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF B5 Control Register (Page 22h/Addr 15h)

*Table 252: CFP UDF B5 Control Register (Page 22h: Address 15h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_B5 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_B5 | R/W | The offset used for UDF_B5 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF B6 Control Register (Page 22h/Addr 16h)

*Table 253: CFP UDF B6 Control Register (Page 22h: Address 16h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_B6 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_B6 | R/W | The offset used for UDF_B6 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF B7 Control Register (Page 22h/Addr 17h)

*Table 254: CFP UDF B7 Control Register (Page 22h: Address 17h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_B7 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |

*Table 254:  CFP UDF B7 Control Register (Page 22h: Address 17h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 5:0 | UDF_OFFSET_B7 | R/W | The offset used for UDF_B7 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

## CFP UDF B8 Control Register (Page 22h/Addr 18h)

*Table 255:  CFP UDF B8 Control Register (Page 22h: Address 18h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_B8 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_B8 | R/W | The offset used for UDF_B8 which is used in Slice1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

## CFP UDF B9 Control Register (Page 22h/Addr 19h)

*Table 256:  CFP UDF B9 Control Register (Page 22h: Address 19h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_B9 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_B9 | R/W | The offset used for UDF_B9 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF B10 Control Register (Page 22h/Addr 1Ah)

*Table 257:  CFP UDF B10 Control Register (Page 22h: Address 1Ah)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_B10 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_B10 | R/W | The offset used for UDF_B10 which is used in Slice 1. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF C0 Control Register (Page 22h/Addr 20h)

*Table 258:  CFP UDF C0 Control Register (Page 22h: Address 20h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_C0 | R/W | Flag indicating the type of field for starting address<br>• 11 = start of packet (Revision B silicon)<br>• 11 = reserved (Revision A silicon)<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_C0 | R/W | The offset used for UDF_C0 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

# CFP UDF C1 Control Register (Page 22h/Addr 21h)

*Table 259:  CFP UDF C1 Control Register (Page 22h: Address 21h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_C1 | R/W | Flag indicating the type of field for starting address<br>• 11 = start of packet (Revision B silicon)<br>• 11 = reserved (Revision A silicon)<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |

*Table 259:  CFP UDF C1 Control Register (Page 22h: Address 21h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 5:0 | UDF_OFFSET_C1 | R/W | The offset used for UDF_C1 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

## CFP UDF C2 Control Register (Page 22h/Addr 22h)

*Table 260:  CFP UDF C2 Control Register (Page 22h: Address 22h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_C2 | R/W | Flag indicating the type of field for starting address<br>• 11 = start of packet (Revision B silicon)<br>• 11 = reserved (Revision A silicon)<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_C2 | R/W | The offset used for UDF_C2 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 16 bits (2-bytes) | 0 |

## CFP UDF D0 Control Register (Page 22h/Addr 30h)

*Table 261:  CFP UDF D0 Control Register (Page 22h: Address 30h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_D0 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_D0 | R/W | The offset used for UDF_D0 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 32 bits (4-bytes) | 0 |

# CFP UDF D1 Control Register (Page 22h/Addr 31h)

*Table 262: CFP UDF D1 Control Register (Page 22h: Address 31h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_D1 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_D1 | R/W | The offset used for UDF_D1 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 32 bits (4-bytes) | 0 |

# CFP UDF D2 Control Register (Page 22h/Addr 32h)

*Table 263: CFP UDF D2 Control Register (Page 22h: Address 32h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_D2 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_D2 | R/W | The offset used for UDF_D2 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 32 bits (4-bytes) | 0 |

# CFP UDF D3 Control Register (Page 22h/Addr 33h)

*Table 264: CFP UDF D3 Control Register (Page 22h: Address 33h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_D3 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |

*Table 264:  CFP UDF D3 Control Register (Page 22h: Address 33h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 5:0 | UDF_OFFSET_D3 | R/W | The offset used for UDF_D3 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 32 bits (4-bytes) | 0 |

# CFP UDF D4 Control Register (Page 22h/Addr 34h)

*Table 265:  CFP UDF D4 Control Register (Page 22h: Address 34h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_D4 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_D4 | R/W | The offset used for UDF_D4 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 32 bits (4-bytes) | 0 |

# CFP UDF D5 Control Register (Page 22h/Addr 35h)

*Table 266:  CFP UDF D5 Control Register (Page 22h: Address 35h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_D5 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_D5 | R/W | The offset used for UDF_D5 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 32 bits (4-bytes) | 0 |

# CFP UDF D6 Control Register (Page 22h/Addr 36h)

*Table 267: CFP UDF D6 Control Register (Page 22h: Address 36h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_D6 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_D6 | R/W | The offset used for UDF_D6 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 32 bits (4-bytes) | 0 |

# CFP UDF D7 Control Register (Page 22h/Addr 37h)

*Table 268: CFP UDF D7 Control Register (Page 22h: Address 37h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | UDF_REF_D7 | R/W | Flag indicating the type of field for starting address<br>• 11 = reserved<br>• 10 = end of IP header (including IPv4 option)<br>• 01 = end of Ether Type<br>• 00 = end of Tag | 0 |
| 5:0 | UDF_OFFSET_D7 | R/W | The offset used for UDF_D7 which is used in Slice 2. The number counts from the reference port of frame. Rx port extracts 16 bits of data from the corresponding location for CFP lookup. Unit: 32 bits (4-bytes) | 0 |

# Page 30h: QoS Registers

*Table 269:  QoS Registers (Page 30h)*

| Address | Bits | Description |
|---------|------|-------------|
| 00h–0Fh | Reserved | |
| 10h–17h | 64 | "QoS Control Register (Page 30h/Addr 10h–17h)" on page 289 |
| 18h–1Fh | 64 | "QoS 802.1p Enable Register (Page 30h/Addr 18h–1Fh)" on page 290 |
| 20h–27h | 64 | "QoS DiffServ Enable Register (Page 30h/Addr 20h–27h)" on page 291 |
| 28h–2Fh | 64 | "QoS Pause Enable Register (Page 30h/Addr 28h–2Fh)" on page 292 |
| 30h–31h | 16 | "Priority Threshold Register (Page 30h/Addr 30h–31h)" on page 292 |
| – | Reserved | |
| 40h–47h | 64 | "DiffServ DSCP Priority Register (Page 30h/Addr 40h–4Fh)" on page 293 |
| 48h–4Fh | 64 | DiffServ DSCP Priority register 2 |
| 58h–5Fh | 16 | "QoS Reason Code Enable Register (Page 30h/Addr 58h–59h)" on page 293 |
| 60h | Reserved | |
| F0h–F7h | 64 | SPI Data I/O[0:7] |

# QoS Control Register (Page 30h/Addr 10h–17h)

*Table 270: QoS Control Register (Pages: 30h, Address 10h–17h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63 | CPU Control Enable | R/W | • 1 = Register values control the port-based priority settings. This includes:<br>  – QOS_Enable setting (bit 59:58 of this register).<br>  – Flow control enable/disable is controlled on a per- port basis in the "QoS Pause Enable Register (Page 30h/Addr 28h–2Fh)" on page 292.<br>• 0 = Reserved. | 1 |
| 62:61 | RSVD | RO | Reserved<br>Write default. Ignore on read. | 0 |
| 60 | dis_autoset_qosreg | RW | Disable Automatically Set QoS Thresholds<br>This bit selects the values to use for control bits/ thresholds defined in Page 0Ah for QoS On/Off.<br>• 1 = Set this bit if custom MMU setting is desired. User is responsible to program the desired values for Page 0Ah manually for both QoS On / Off.<br>• 0 = The default values for Page 0Ah are set automatically for QoS On / Off. | 0 |
| 59:58 | QOS_Enable | R/W | Select the number of priority queues.<br>• 11 = When CPU Control Enable (bit 63) is asserted, setting these bits to 11 enables the four-queue QoS function.<br>• 10 = Reserved<br>• 01 = Reserved<br>• 00 = When CPU Control Enable (bit 63) is asserted, setting these bits to 00 disables QoS and enables the single-queue function. | 00 |
| 57:2 | RSVD | RO | Reserved<br>Write default. Ignore on read. | 0 |
| 1:0 | PRI_SEL | R/W | Priority Scheduling<br>• 00: 4 WRR (Default)<br>• 01: 1 SP - 3 WRR<br>• 10: 2 SP - 2 WRR<br>• 11: 4 SP | 00 |

# QoS 802.1p Enable Register (Page 30h/Addr 18h–1Fh)

*Table 271: QoS 802.1p Enable Register (Page 30h: Address 18h–1Fh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:51 | RSVD | RO | Reserved<br>Write default. Ignore on read. | 0 |
| 50:24 | QOS_1P_EN | R/W | 802.1p QoS enable bit for per-port.<br>A 27-bit mask which selectively allows any port with its corresponding bit set, to enable 802.1p QoS.<br>• Bit 50 = GigaPort G1<br>• Bit 49 = GigaPort G0<br>• Bit 48 = IMP<br>• Bits 47:24 = 10/100 ports [port 23–port 0] | 6-FFFF-FF |
| 23:0 | RSVD | – | Reserved | 0 |

# QoS DiffServ Enable Register (Page 30h/Addr 20h–27h)

*Table 272:  QoS DiffServ Enable Register (Page 30h: Address 20h–27h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:51 | RSVD | RO | Reserved<br>Write default. Ignore on read. | 0 |
| 50:24 | QoS_Diff_EN | R/W | DiffServ QoS enable bit for per-port.<br>A 27-bit mask which selectively allows any port with its corresponding bit set, to enable DiffServ QoS.<br>• Bit 50 = GigaPort G1<br>• Bit 49 = GigaPort G0<br>• Bit 48 = IMP<br>• Bits 47:24 = 10/100 ports [port 23–port 0] | 0 |
| 23:0 | RSVD | – | Reserved | 0 |

# QoS Pause Enable Register (Page 30h/Addr 28h–2Fh)

*Table 273: QoS Pause Enable Register (Page 30h: Address 28h–2Fh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:51 | RSVD | RO | Reserved<br>Write default. Ignore on read. | 0 |
| 50:49 | GE_PAUSE_EN | R/W | Per port QoS PAUSE Enable bit.<br>• Bit 50 = GigaPort G1<br>• Bit 49 = GigaPort G0 | 0 |
| 48 | IMP_PAUSE_EN | R/W | Per port QoS PAUSE Enable bit.<br>• Bit 48 = IMP or as a network port. | 0 |
| 47:24 | FE_PAUSE_EN | R/W | Per port QoS PAUSE Enable bit.<br>A 24-bit mask which selectively allows any port with its corresponding bit set, to enable PAUSE.<br>Bits 47:24 = 10/100 ports [port 23–port 0] | 0 |
| 23:0 | RSVD | – | Reserved | 0 |

Note: When software control of QoS is enabled by asserting the QOS_Enable, bits[59:58] of the "QoS Control Register (Page 30h/Addr 10h–17h)" on page 289, the QoS PAUSE Enable of individual port is controlled by setting:

- 0 = Half-duplex back pressure and full-duplex flow control are disabled. Only dropping of frames is supported on the given port.
- 1 = Individual port supports half-duplex back pressure and full-duplex flow control.

However, the per port PAUSE_EN state (if enabled) allows transmission of the Pause frame only from the switch when buffers are near capacity. When the link partner sends Pause frame, the switch does not pause transmission. Any change of state on PAUSE_EN has neither effect on the "Pause Status Summary Register (Page 02h/Addr 30h–37h)" on page 193.

# Priority Threshold Register (Page 30h/Addr 30h–31h)

*Table 274: Priority Threshold Register (Page 30h: Address 30h–31h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:14 | 802.1p Priority Tag 111 | R/W | These two bits are used to assign priority queue of tag 111. | 3h |
| 13:12 | 802.1p Priority Tag 110 | R/W | These two bits are used to assign priority queue of tag 110. | 3h |
| 11:10 | 802.1p Priority Tag 101 | R/W | These two bits are used to assign priority queue of tag 101. | 2h |
| 9:8 | 802.1p Priority Tag 100 | R/W | These two bits are used to assign priority queue of tag 100. | 2h |
| 7:6 | 802.1p Priority Tag 011 | R/W | These two bits are used to assign priority queue of tag 011. | 1h |
| 5:4 | 802.1p Priority Tag 010 | R/W | These two bits are used to assign priority queue of tag 010. | 1h |

*Table 274: Priority Threshold Register (Page 30h: Address 30h–31h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 3:2 | 802.1p Priority Tag 001 | R/W | These two bits are used to assign priority queue of tag 001. | 0h |
| 1:0 | 802.1p Priority Tag 000 | R/W | These two bits are used to assign priority queue of tag 000. | 0h |

## DiffServ DSCP Priority Register (Page 30h/Addr 40h–4Fh)

Register 40h to register 4Fh are used to assign priority to different Differentiated Service. To provides 4 priority queues and 64 different traffic classes, a 64x2 table is needed. Each entry represents one traffic class. Two bits in an entry represents the priority of that traffic.

Table 275 and Table 276 define four entries: the remaining 60 traffic classes have the same format (they are not represented in this document).

*Table 275: DiffServ DSCP Priority Register 1 (Page 30h: Address 40h–47h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:62 | Priority of DSCP=011111 | R/W | See detail description above. | 0 |
| ….. | ……………….. | R/W | | |
| 7:6 | Priority of DSCP=000011 | R/W | See detail description above. | 0 |
| 5:4 | Priority of DSCP=000010 | R/W | See detail description above. | 0 |
| 3:2 | Priority of DSCP=000001 | R/W | See detail description above. | 0 |
| 1:0 | Priority of DSCP=000000 | R/W | See detail description above. | 0 |

*Table 276: DiffServ DSCP Priority Register 2 (Page 30h: Address 48h–4Fh)*

| Bit | Name | R/W | Description | Default |

| 50:24 | Enable Drop Non 1Q Frame | R/W | Enable Drop Non 1Q Frames.<br>A 27-bit mask corresponds to the physical ports on the chip. Setting any bit to 1 enables non_1Q (untagged or priority tagged) ingress frame to be dropped by the corresponding port.<br>• Bit 50 = GigaPort G1<br>• Bit 49 = GigaPort G0<br>• Bit 48 = IMP.<br>• Bits 47:24 = 10/100 ports [port 23–port 0] | 0 |
| 23:0 | RSVD | – | Reserved | 0 |

# 802.1Q Control 4 Register (Page 34h/Addr 03h)

*Table 288: 802.1Q Control 4 Register (Pages: 34h, Address 03h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:6 | Ingress_VID_check | R/W | Perform ingress VLAN source port membership check. Ingress VID violation is detected when the source port is not found in the VLAN Fwd_Map that is referred to by the ingress VID.<br><br>• 00: Forward ingress VID violation frame but do not learn SA into ARL table.<br>• 01: Drop frame if ingress VID violation is detected.<br>• 10: Bypass checking for ingress VID violation but SA is learned into ARL table.<br><br>*Note:* Ingress_VID_check does not apply to the IMP configured as management port. | 10 |
| 5 | Mngt_Rcv_GVRP | R/W | Forward GVRP frame to management port<br><br>When set this bit to 1, forward GVRP frames to management port. | 0 |
| 4 | Mngt_Rcv_GMRP | R/W | Forward GMRP frame to management port<br><br>When set this bit to 1, forward GMRP frames to management port. | 0 |
| 3:2 | RSVD | RO | Reserved.<br>Write default. Ignore on read. | 0 |
| 1 | VLAN_VLAN_OPT | R/W | VLAN to VLAN Table Optional Control (Revision B Silicon only). This bit selects the index used to search the VLAN to VLAN table.<br><br>*Note:* PORTID is referred to as the physical port ID. The logical port ID starts from 0, 1, 2, ... The physical port ID starts from 24, 25, 26..... The logical to physical port ID mapping is as follows:<br><br>Logical Port ID    PORTID<br>    0           24<br>    1           25<br>    2           26<br>   ...         ...<br>   23        47<br>  IMP       48<br>GigaPort G0    49<br>Gigaport G1    50<br>• 0 = Select VID[11:0] as the index<br>• 1 = Select {(PORTID-24)[4:0], VID[6:0]} as the index | 0 |
| 0 | RSVD | RO | Reserved.<br>Write default. Ignore on read. | 0 |

# 802.1Q Control 5 Register (Page 34h/Addr 04h)

*Table 289:  802.1Q Control 5 Register (Pages: 34h, Address 04h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7 | RSVD | – | Reserved | 0 |
| 6 | Preserve_non_1Q | R/W | Egress non_1Q frame control.<br>• 1 = Preserve ingress non_1Q frames.<br>• 0 = Apply VLAN rules if enabled to ingress non_1Q frames. | 0 |
| 5 | Dis_Egress_Dir_Bypass _Trunking | R/W | Disable Egress Direct Frame Trunking Rule Check.<br>• 1 = Egress direct frames from the host management system do not bypass trunking rule check.<br>• 0 = Allow egress direct frames from the host management system to bypass. | 0 |
| 4 | RSVD | RO | Reserved.<br>Write as default. Ignore on read. | 1 |
| 3 | drop_Vtable_miss | R/W | Ingress VID is pointing to a nonvalid entry in the VLAN table. When set to:<br>• 1, a frame with VLAN table miss is dropped.<br>• 0, a frame with VLAN table miss is trapped to IMP. | 0 |
| 2 | RSVD | RO | Reserved.<br>Write default. Ignore on read. | 0 |
| 1 | Bypass_Mngt_Rx_CRC_ Chk | R/W | Bypass CRC Check at Management port.<br>• 1 = The management port with CPU on it ignores any CRC from BRCM tagged frame or Ethernet frame.<br>• 0 = The management port checks both CRCs.<br>*Note:* With this option, CPU does not need to calculate CRC for BRCM tagged frame. However it is still required to include a place holder for the BRCM tag CRC. | 0 |
| 0 | RSVD | R/W | Write default. Ignore on read. | 0 |

*Note:* For normal operation, Broadcom recommends to set bits 3, 1, and 0 of this register to 1.

# 802.1Q Default Port Tag Register (Page 34h/Addr 40h–75h)

See Table 291: "Default 802.1Q Tag," on page 309.

*Table 290:  802.1Q Default Port Tag Register (Page: 34h, Address 40h–75h)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| Addr 40h–41h bit [15:0] | Default Tag Port 0 | R/W | Default 802.1Q tag assigned to port 0. | 0018h |
| Addr 42h–43h bit [15:0] | Default Tag Port 1 | R/W | Default 802.1Q tag assigned to port 1. | 0019h |
| Addr 44h–45h bit [15:0] | Default Tag Port 2 | R/W | Default 802.1Q tag assigned to port 2. | 001Ah |

*Table 304:  EAP Destination IP Register 0 (Page 41h, Address 00h–07h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:32 | DIP_SUB_REG_0 | R/W | EAP Destination IP Subnet register 0 | FFFFFFFF |
| 31:0 | DIP_MASK_REG_0 | R/W | EAP Destination IP Mask register 0 | FFFFFFFF |

## EAP Destination IP Register 1 (Page 41h/Addr 08h–0Fh)

*Table 305:  EAP Destination IP Register 1 (Page 41h, Address 08h–0Fh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 63:32 | DIP_SUB_REG_1 | R/W | EAP Destination IP Subnet register 1 | FFFFFFFF |
| 31:0 | DIP_MASK_REG_1 | R/W | EAP Destination IP Mask register 1 | FFFFFFFF |

## EAP Global Configuration Register (Page 41h/Addr 10h–11h)

*Table 306:  EAP Global Configuration Register (Page 41h, Address 10h–11h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:13 | RSVD | RO | Reserved<br>Write default. Ignore on read. | 0 |

*Table 306: EAP Global Configuration Register (Page 41h, Address 10h–11h)  (Cont.)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 12 | EN_DHCP | R/W | DHCP Frame Control. <br><br>When EAP_MODE is set, setting this bit to accept DHCP frames otherwise reject DHCP frames [Default]. <br>• 1 = Accept DHCP frames. <br>• 0 = Reject DHCP frames. | 0 |
| 11 | EN_DIP_1 | R/W | Enable Destination IP Address when EAP_MODE is set. When set, IPv4 packet with destination IP address matched with EAP Destination IP register 1 passes. | 0 |
| 10 | EN_DIP_0 | R/W | Enable Destination IP Address when EAP_MODE is set. <br><br>When set, IPv4 packet with destination IP address matched with EAP Destination IP register 0 passes. | 0 |
| 9 | EN_ARP | R/W | Enable ARP frame when EAP_MODE is set. <br><br>When set, ARP frame (DA = FF-FF-FF-FF-FF-FF and LT = 08-06) passes. | 0 |
| 8 | EN_MAC_22-2F | R/W | Enable (DA = 01-80-c2-00-00-22 ~ 01-80-c2-00-00-2F) frames passed when EAP_MODE is set. | 0 |
| 7 | EN_MAC_21 | R/W | Enable (DA = 01-80-c2-00-00-21) frame passed when EAP_MODE is set. | 0 |
| 6 | EN_MAC_20 | R/W | Enable (DA = 01-80-c2-00-00-20) frame passed when EAP_MODE is set. | 0 |
| 5 | EN_MAC_11-1F | R/W | Enable (DA = 01-80-c2-00-00-11 ~ 01-80-c2-00-00-1F) frames passed when EAP_MODE is set. | 0 |
| 4 | EN_MAC_10 | R/W | Enable (DA = 01-80-c2-00-00-10) frame passed when EAP_MODE is set. | 0 |
| 3 | EN_MAC_02_04-0F | R/W | Enable (DA = 01-80-c2-00-00-02) or (DA = 01-80-c2-00-00-04 ~ 01-80-c2-00-00-040F) frame passed when EAP_MODE is set. | 0 |
| 2 | EN_MAC_BPDU | R/W | Enable BPDU frame passed when EAP_MODE is set. | 0 |
| 1 | RSVD | – | Reserved | 0 |
| 0 | EN_EAP_PT_CHK | R/W | Enable EAP Frame Packet Type Check. | 0 |

# Learning Counter Control Register (Page 41h/Addr 18h–19h)

*Table 307:  Learning counter Control Register (Page 40h, Address 18h–19h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | START/DONE | R/W | Start/Done command. Write 1 to initiate software learning counter control. | 0 |

*Table 307: Learning counter Control Register (Page 40h, Address 18h–19h) (Cont.)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 14:13 | ACC_CTRL | R/W | Access Control<br>11 = Reset to 0 in corresponding port<br>10 = decrease by 1 in corresponding port<br>01 = increase by 1 in corresponding port<br>00 = no operation | 0 |
| 12:6 | RSVD | – | Reserved | 0 |
| 5:0 | PORT_NUMBER | R/W | Port Number | 0 |

# Port Max Learn Register (Page 41h/Addr 20h–5Fh)

*Table 308:  Port Max Learn Register (Page 41h/Addr 20h–5Fh)*

| Address | Port | R/W | Description | Default |
|---|---|---|---|---|
| Addr 20h–21h bit [15:0] | Port 0 | R/W | Max Learn Number of Addresses | 0x1fff |
| Addr 22h–23h bit [15:0] | Port 1 | R/W | Max Learn Number of Addresses | 0x1fff |
| Addr 24h–25h bit [15:0] | Port 2 | R/W | Max Learn Number of Addresses | 0x1fff |

# MII Control Register (Page A0h–B7h/Addr 00h–01h)

*Table 327:  MII Control Register (Pages A0h–B7h, Address 00h–01h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | Reset | R/W (SC) | • 1 = PHY reset.<br>• 0 = Normal operation. | 0 |
| 14 | Loopback | R/W | • 1 = Loopback mode.<br>• 0 = Normal operation. | 0 |
| 13 | Forced Speed Selection | R/W | • 1 = 100 Mbps.<br>• 0 = 10 Mbps. | 1 |
| 12 | Auto-negotiation Enable | R/W | • 1 = Auto-negotiation enable.<br>• 0 = Auto-negotiation disable. | 1 |
| 11 | Power Down | RO | • 0 = Normal operation.<br>• The BCM53242M does not implement a low-power mode. | 0 |
| 10 | Isolate | R/W | • 1 = Electrically isolate PHY from MII.<br>• 0 = Normal operation. | 0 |
| 9 | Restart Auto-negotiation | R/W (SC) | • 1 = Restart auto-negotiation process.<br>• 0 = Normal operation. | 0 |
| 8 | Duplex Mode | R/W | • 1 = Full-duplex.<br>• 0 = Half-duplex. | 0 |
| 7:0 | Reserved | RO | Ignore when read. | 0 |

***Note:*** R/W = Read/Write, RO = Read only, SC = Self Clear, LL = Latched Low, LH = Latched High, LL and LH Clear after read operation.

## Reset

To reset an individual part PHY, the BCM53242M by software control, a 1 must be written to bit 15 of the Control register using an MII write operation. The bit clears itself after the reset process is complete, and need not be cleared using a second MII write. Writes to other Control register bits have no effect until the reset process is completed, which requires approximately 1 µs. Writing a 0 to this bit has no effect. Because this bit is self-clearing, after a few cycles from a write operation, it returns a 0 when read.

## Loopback

An individual part of the BCM53242M can be placed into loopback mode by writing a 1 to bit 14 of the Control register. The loopback mode can be cleared by writing a 0 to bit 14 of the control register, or by resetting the chip. When this bit is read, it returns a 1 when the chip is in software-controlled loopback modes; otherwise it returns a 0.

## Forced Speed Selection

If auto-negotiation is enabled, this bit has no effect on the speed selection. However, if auto-negotiation is disabled by software control, the operating speed of the BCM53242M port can be forced by writing the appropriate value to bit 13 of the Control register. Writing a 1 to this bit forces 100Base-X operation, while writing a 0 forces 10Base-T operation. When this bit is read, it returns the value of the software-controlled forced speed selection only. To read the overall state of forced speed selection, including both hardware and software control, use bit 8 of the Auxiliary Control register.

## Auto-Negotiation Enable

Auto-negotiation is enabled by default. If bit 12 of the Control register is written with a value of 0, auto-negotiation is disabled by software control. Writing a 1 to the same bit of the Control register or resetting the chip re-enables auto-negotiation. When read, this bit returns the value most recently written to this location, or 1 if it has not been written since the last chip reset.

## Power Down

The BCM53242M does not implement a low-power mode.

## Isolate

Each individual PHY can be isolated from its Media Independent Interface by writing a 1 to bit 10 of the Control register. All MII outputs are ri-stated and all MII inputs are ignored. Because the MII management interface is still active, the isolate mode can be cleared by writing a 0 to bit 10 of the control register, or by resetting the chip. When this bit is read, it returns a 1 when the chip is in isolate mode; otherwise it returns a 0.

## Restart Auto-Negotiation

Bit 9 of the Control register is a self-clearing bit that allows the auto-negotiation process to be restarted, regardless of the current status of the auto-negotiation state machine. For this bit to have an effect, auto-negotiation must be enabled. Writing a 1 to this bit restarts the auto-negotiation, while writing a 0 to this bit has no effect. Because the bit is self-clearing after only a few cycles, it always returns a 0 when read. The operation of this bit is identical to bit 9 of the Auxiliary Multiple PHY register.

## Duplex Mode

By default, at reset this bit indicates BCM53242M half-duplex mode. If the Auto-negotiation is enabled, this bit has no effect on the duplex selection. The chip can be forced into full-duplex mode by writing a 1 to bit 8 of the Control register while auto-negotiation is disabled. Half-duplex mode can be resumed by writing a 0 to bit 8 of the control register, or by resetting the chip.

## Reserved Bits

All reserved MII register bits must be written as 0 at all times. Ignore the BCM53242M output when these bits are read.

# MII Status Register (Page A0h–B7h/Addr 02h–03h)

*Table 328: MII Status Register (Pages A0h–B7h, Address 02h–03h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | 100Base-T4 Capability | RO | 0 = Not 100Base-T4 capable. | 0 |
| 14 | 100Base-TX FDX Capability | RO | 1 = 100Base-TX full-duplex capable. | 1 |
| 13 | 100Base-TX Capability | RO | 1 = 100Base-TX half-duplex capable. | 1 |
| 12 | 10Base-T FDX Capability | RO | 1 = 10Base-T full-duplex capable. | 1 |
| 11 | 10Base-T Capability | RO | 1 = 10Base-T half-duplex capable. | 1 |
| 10:7 | Reserved | RO | Ignore when read. | 0 |
| 6 | MF Preamble Suppression | R/W | • 1 = Preamble may be suppressed.<br>• 0 = Preamble always required. | 0 |
| 5 | Auto-negotiation Complete | RO | • 1 = Auto-negotiation process completed.<br>• 0 = Auto-negotiation process not completed. | 0 |
| 4 | Remote Fault | RO LH | • 1 = Remote/far-end fault condition detected.<br>• 0 = No remote/far-end fault condition detected. | 0 |
| 3 | Auto-negotiation Capability | RO | • 1 = Auto-negotiation capable.<br>• 0 = Not auto-negotiation capable. | 1 |
| 2 | Link Status | RO LL | • 1 = Link is up (Link Pass state).<br>• 0 = Link is down (Link Fail state). | 0 |
| 1 | Jabber Detect | RO LH | • 1 = Jabber condition detected.<br>• 0 = No jabber condition detected. | 0 |
| 0 | Extended Capability | RO | 1 = Extended register capable. | 1 |

*Note:* R/W = Read/Write, RO = Read only, SC = Self Clear, LL = Latched Low, LH = Latched High, LL & LH Clear after read operation.

## 100Base-T4 Capability

The BCM53242M is not capable of 100Base-T4 operation, and returns a 0 when bit 15 of the status register is read.

## 100Base-X Full-Duplex Capability

The BCM53242M is capable of 100Base-X full-duplex operation, and returns a 1 when bit 14 of the Status register is read.

## 100Base-X Half-Duplex Capability

The BCM53242M is capable of 100Base-X half-duplex operation, and returns a 1 when bit 13 of the Status register is read.

## 10Base-T Full-Duplex Capability

The BCM53242M is capable of 10Base-T full-duplex operation, and returns a 1 when bit 12 of the Status register is read.

## 10Base-T Half-Duplex Capability

The BCM53242M is capable of 10Base-T half-duplex operation, and returns a 1 when bit 11 of the Status register is read.

## Reserved Bit

Ignore the BCM53242M output when these bits are read.

## MF Preamble Suppression

This bit is the only writable bit in the Status register. Setting this bit to a 1 allows subsequent MII management frames to be accepted with or without the standard preamble pattern. When Preamble Suppression is enabled, only 2 preamble bits are required between successive Management Commands, instead of the normal 32.

## Auto-Negotiation Complete

Bit 5 of the Status register returns a 1 if the auto-negotiation process has been completed and the contents of registers 4, 5 and 6 are valid.

## Remote Fault

When set at the completion of auto-negotiation, indicates that a remote fault condition has been signaled by the link partner. When set in 100Base-FX mode, indicates that a far-end fault condition has been detected. This bit is latched high, and self-clears when read. Is immediately set once again in FX mode after clearing if the far-end fault condition remains true.

## Auto-Negotiation Capability

The BCM53242M can perform IEEE auto-negotiation, and returns a 1 when bit 4 of the Status register is read, regardless of whether the auto-negotiation function has been disabled.

## Link Status

The BCM53242M returns a 1 on bit 2 of the Status register when the link state machine is in Link Pass, indicating that a valid link has been established. Otherwise, it returns 0. When a link failure occurs after the Link Pass state has been entered, the Link Status bit is latched at 0 and remains so until the bit is read. After the bit is read, it becomes 1 if the Link Pass state has been entered again.

## Jabber Detect

10Base-T operation only. The BCM53242M returns a 1 on bit 1 of the Status register if a jabber condition has been detected. After the bit is read, or if the chip is reset, it reverts to 0.

## Extended Capability

The BCM53242M supports extended capability registers, and returns a 1 when bit 0 of the Status register is read. Several extended registers have been implemented in the BCM53242M, and their bit functions are defined later in this section.

## PHY Identifier Registers (Page A0h–B7h/Addr 04h–07h)

*Table 329: PHY Identifier Registers (Pages A0h–B7h, Addresses 04h–05h and 06h–07h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:0 | MII Address 00010 | RO | PHYID HIGH | 0143h |
| 15:0 | MII Address 00011 | RO | PHYID LOW | BF1Nh[a] |

a. Refer to Table 210 on page 259 for the value of N and the associated chip revision.

## Auto-Negotiation Advertisement Register (Page A0h–B7h/Addr 08h–09h)

*Table 330: Auto-Negotiation Advertisement Register (Pages A0h–B7h, Address 08h–09h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | Next Page | R/W | • 1 = Next Page Operation supported.<br>• 0 = Next Page Operation disabled. | 0 |
| 14 | Reserved | RO | Ignore when Read. | – |
| 13 | Remote Fault | R/W | 1 = Transmit Remote Fault. | 0 |
| 12:11 | Reserved Technologies | RO | Ignore when Read. | – |
| 10 | Advertise Pause Capability | R/W | 1 = Pause Operation for full-duplex. | 1 |
| 9 | Advertise 100Base-T4 | R/W | 0 = Do Not Advertise T4 Capability. | 0 |
| 8 | Advertise 100Base-X FDX | R/W | • 1 = Advertise 100Base-X full-duplex.<br>• 0 = Do Not Advertise 100Base-X full-duplex. | 1 |
| 7 | Advertise 100Base-X | R/W | 1 = Advertise 100Base-X. | 1 |
| 6 | Advertise 10Base-T FDX | R/W | • 1 = Advertise 10Base-T full-duplex.<br>• 0 = Do Not Advertise 10Base-T full-duplex. | 1 |
| 5 | Advertise 10Base-T | R/W | 1 = Advertise 10Base-T. | 1 |
| 4:0 | Advertise Selector Field | R/W | Fixed value: indicates 802.3. | 00001 |

### Next Page

The BCM53242M supports the Next Page function. To enable this operation, write a 1 to this bit.

### Remote Fault

Writing a 1 to bit 13 of the Advertisement register sends a Remote Fault indicator to the Link Partner during auto-negotiation. Writing a 0 to this bit or resetting the chip clears the Remote Fault transmission bit. This bit returns the value last written to it, or else 0 if no write has been completed since the last chip reset.

## Reserved Bits

Ignore output when read.

## Pause Operation for Full-Duplex Links

The use of this bit is independent of the negotiated data rate, medium, or link technology. The setting of this bit indicates the availability of additional DTE capability when full-duplex operation is in use. This bit is used by one MAC to communicate Pause Capability to its Link Partner and has no effect on PHY operation.

## Advertisement Bits

Use bits 9:5 of the Advertisement register to customize the ability information transmitted to the Link Partner. The default value for each bit reflects the abilities of the BCM53242M. By writing a 1 to any of the bits, the corresponding ability is transmitted to the Link Partner. Writing a 0 to any bit causes the corresponding ability to be suppressed from transmission. Resetting the chip restores the default bit values. Reading the register returns the values last written to the corresponding bits, or else the default values if no write has been completed since the last chip reset.

## Selector Field

Bits 4:0 of the Advertisement register contain the value 00001, indicating that the chip belongs to the 802.3 class of PHY transceivers

# Auto-Negotiation Link Partner Ability Register (Page A0h–B7h/Addr 0Ah–0Bh)

*Table 331:  Auto-Negotiation Link Partner Ability Register (Pages A0h–B7h, Address 0Ah–0Bh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | LP Next Page | RO | Link Partner next page bit. | 0 |
| 14 | LP Acknowledge | RO | Link Partner acknowledge bit. | 0 |
| 13 | LP Remote Fault | RO | Link Partner remote fault indicator. | 0 |
| 12:11 | Reserved Technologies | RO | Ignore when read. | 000 |
| 10 | LP Advertise Pause | RO | Link Partner has Pause Capability. | 0 |
| 9 | LP Advertise 100Base-T4 | RO | Link Partner has 100Base-T4 capability. | 0 |
| 8 | LP Advertise 100Base-X FDX | RO | Link Partner has 100Base-X FDX capability. | 0 |
| 7 | LP Advertise 100Base-X | RO | Link Partner has 100Base-X capability. | 0 |
| 6 | LP Advertise 10Base-T FDX | RO | Link Partner has 10Base-T FDX capability. | 0 |
| 5 | LP Advertise 10Base-T | RO | Link Partner has 10Base-T capability. | 0 |
| 4:0 | Link Partner Selector Field | RO | Link Partner selector field. | 00000 |

The values contained in the Auto-negotiation Link Partner Ability register are only guaranteed to be valid after auto-negotiation has successfully completed, as indicated by bit 5 of the MII Status register.

## Next Page

Bit 15 of the Link Partner Ability register returns a value of 1 when the Link Partner implements the Next Page function and has Next Page information to transmit.

## Acknowledge

Bit 14 of the Link Partner Ability register is used by auto-negotiation to indicate that a device has successfully received its Link Partner's Link Code Word.

## Remote Fault

Bit 13 of the Link Partner Ability register returns a value of 1 when the Link Partner signals that a remote fault has occurred. The BCM53242M simply copies the value to this register and does not act upon it.

## Reserved Bits

Ignore when read.

## Pause

Indicates that the Link Partner pause bit is set.

## Advertisement Bits

Bits 9:5 of the Link Partner Ability register reflect the abilities of the Link Partner. A 1 on any of these bits indicates that the Link Partner is capable of performing the corresponding mode of operation. Bits 9:5 are cleared any time auto-negotiation is restarted or the BCM53242M is reset.

## Selector Field

Bits 4:0 of the Link Partner Ability register reflect the value of the Link Partner's selector field. These bits are cleared any time auto-negotiation is restarted or the chip is reset.

# Auto-Negotiation Expansion Register (Page A0h–B7h/Addr 0Ch–0Dh)

*Table 332:  Auto-Negotiation Expansion Register (Pages A0h–B7h, Address 0Ch–0Dh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15:5 | Reserved | RO | Ignore when read. | |
| 4 | Parallel Detection Fault | RO LH | • 1 = Parallel Detection fault.<br>• 0 = No Parallel Detection fault. | 0 |

*Table 332:  Auto-Negotiation Expansion Register (Pages A0h–B7h, Address 0Ch–0Dh)*

| Bit | Name | R/W | Description | Default |
|---|---|---|---|---|
| 3 | Link Partner Next Page Able | RO | • 1 = Link Partner has Next Page capability.<br>• 0 = Link Partner does not have Next Page capability. | 0 |
| 2 | Next Page Able | RO | • 1 = Next Page is enabled.<br>• 0 = Next Page capability. | – |
| 1 | Page Received | RO | • 1 = New page has been received.<br>• 0 = New page has not been received. | 0 |
| 0 | Link Partner Auto-negotiation Able | RO<br>LH | • 1 = Link Partner has auto-negotiation capability.<br>• 0 = Link Partner does not have auto-negotiation capability. | 0 |

*Note:* R/W = Read/Write, RO = Read only, SC = Self Clear, LL = Latched Low, LH = Latched High, LL and LH clear after read operation.

## Parallel Detection Fault

Bit 4 of the Auto-negotiation Expansion register is a read-only bit that gets latched high when a parallel detection fault occurs in the auto-negotiation state machine. For further details, please consult the IEEE standard. The bit is reset to 0 after the register is read, or when the chip is reset.

## Link Partner Next Page Able

Bit 3 of the Auto-negotiation Expansion register returns a 1 when the Link Partner has Next Page capabilities. It has the same value as bit 15 of the Link Partner Ability register.

## Page Received

Bit 1 of the Auto-negotiation Expansion register is latched high when a new Link Code Word is received from the Link Partner, checked, and acknowledged. It remains high until the register is read, or until the chip is reset.

## Link Partner Auto-Negotiation Able

Bit 0 of the Auto-negotiation Expansion register returns a 1 when the Link Partner is known to have auto-negotiation capability. Before any auto-negotiation information is exchanged, or if the Link Partner does not comply with IEEE auto-negotiation, the bit returns a value of 0.

# Auto-Negotiation Next Page Register (Page A0h–B7h/Addr 0Eh–0Fh)

*Table 333:  Next Page Transmit Register (Pages A0h–B7h, Address 0Eh–0Fh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | Next Page | R/W | • 1 = Additional Next Page(s) follow.<br>• 0 = Last page. | 0 |
| 14 | Reserved | R/W | Ignore when Read. | 0 |
| 13 | Message Page | R/W | • 1= Message page.<br>• 0 = Unformatted page. | 1 |
| 12 | Acknowledge 2 | R/W | • 1 = Complies with the message.<br>• 0 = Cannot comply with message. | 0 |
| 11 | Toggle | RO | • 1 = Previous value of the transmitted Link Code Word equalled logic 0.<br>• 0 = Previous value of the transmitted Link Code Word equalled logic one. | 0 |
| 10:0 | Message/Unformatted Code Field | R/W | | 1 |

## Next Page

Indicates whether this is the last Next Page to be transmitted.

## Message Page

Differentiates a Message Page from an Unformatted Page.

## Acknowledge 2

Indicates that a device has the ability to comply with the message.

## Toggle

Used by the Arbitration function to ensure synchronization with the Link Partner during Next Page exchange.

## Message Code Field

An 11-bit-wide field, encoding 2048 possible messages.

## Unformatted Code Field

An 11-bit-wide field, which may contain an arbitrary value.

# Link Partner Next Page Register (Page A0h–B7h/Addr 10h–11h)

*Table 334:  Link Partner Next Page Register (Pages A0h–B7h, Address 10h–11h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 15 | Next Page | RO | • 1 = Additional Next Page(s) follow. <br>• 0 = Last page. | 0 |
| 14 | Reserved | RO | Ignore when Read. | 0 |
| 13 | Message Page | RO | • 1 = Message page. <br>• 0 = Unformatted page. | 0 |
| 12 | Acknowledge 2 | RO | • 1 = Complies with the message. <br>• 0 = Cannot comply with message. | 0 |
| 11 | Toggle | RO | • 1 = Previous value of the transmitted Link Code Word equalled logic 0. <br>• 0 = Previous value of the transmitted Link Code Word equalled logic one. | 0 |
| 10:0 | Message/Unformatted Code Field | RO | – | 0 |

## Next Page

indicates whether this is the last Next Page.

## Message Page

Differentiates a Message Page from an Unformatted Page.

## Acknowledge 2

Indicates that Link Partner has the ability to comply with the message.

## Toggle

Used by the Arbitration function to ensure synchronization with the Link Partner during Next Page exchange.

## Message Code Field

An 11-bit-wide field, encoding 2048 possible messages.

## Unformatted Code Field

An 11-bit-wide field, which may contain an arbitrary value.

# Page D8h–DAh: External PHY Registers

Information on the External PHY registers should be obtained from the external PHY data sheet. Data is obtained by polling the registers of the external PHY via the "MDC/MDIO Interface" on page 114. The actual values or meanings of these bits are controlled by the external PHY. Table 335 maps the external PHY register address to the BCM53242M offset address.

*Table 335: External Port MII Registers Page Versus PHY*

| Page | Port # | Hardware PHY address |
|------|--------|----------------------|
| D8h | 48 | 11000 |
| D9 | 49 (G0) | 11001 |
| DA | 50 (G1) | 11010 |

*Table 336: External PHY Registers (Page D8h-DAh)*

| External PHY Register Address | Switch Address | bits | Description |
|-------------------------------|----------------|------|-------------|
| 00h | 00h-01h | 16 | MII Control register |

## SPI Data I/O Register

*Table 338:  SPI Data I/O Register (Maps to All Registers, Address F0h–F7h)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:0 | SPI Data I/O | R/W | SPI data bytes[7:0] | – |

## SPI Status Register

*Table 339:  SPI Status Register (Maps to All Registers, Address FEh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7 | SPIF | RO | SPI Read/Write Complete Flag. | 0 |
| 6 | WCOL | RO | SPI Write Collision | 0 |
| 5 | RACK | RO (SC) | SPI Read Data Ready Acknowledgement (Self-Clearing). | 0 |
| 4:3 | Reserved | RO | Write as 000, ignore when read. | 0 |
| 2 | MDIO Start | RO | Start/Done MDC/MDIO operation | 0 |
| 1 | RXRDY | RO | Rx Ready Flag—Should check every 8 bytes. | 0 |
| 0 | TXRDY | RO | Tx Ready Flag—Should check every 8 bytes. | 0 |

# Page Register

*Table 340:  Page Register (Maps to All Registers, Address FFh)*

| Bit | Name | R/W | Description | Default |
|-----|------|-----|-------------|---------|
| 7:0 | PAGE_REG | R/W | Binary value determines the value of the accessed register page. | 0 |

# Section 9: Electrical Characteristics

## Absolute Maximum Ratings

**Table 341: Absolute Maximum Ratings**

| Symbol | Parameter | Minimum | Maximum | Units |
|--------|-----------|---------|---------|-------|
| $V_{1.2}$ | Supply Voltage | GND–0.3 | 1.32 | V |
| $V_{2.5}$ | Supply Voltage | GND–0.3 | 2.75 | V |
| $V_{3.3}$ | Supply Voltage | GND–0.3 | 3.63 | V |
| $I_I$ | Input Current | – | ±10 | mA |
| $T_{STG}$ | Storage Temperature | –40 | +125 | °C |
| $V_{ESD}$ | Electrostatic Discharge | – | 1000 | V |

*Note:* These specifications indicate conditions where permanent damage to the device may occur. Functional operation is not guaranteed under these conditions. Operation at absolute maximum conditions for extended periods may adversely affect the long-term reliability of the device.

## Recommended Operating Conditions

**Table 342: Recommended Operating Conditions**

| Sym | Parameter | Pins | Mode | Minimum | Maximum | Units |
|-----|-----------|------|------|---------|---------|-------|
| VDD | Supply voltage (see Note) | VDDC, AVDDL | – | 1.14 | 1.26 | V |
| | | VDDO2, BIASVDD, XTALVDD, VDDP | – | 2.375 | 2.625 | V |
| | | VDDO0, VDDO1, VDDO3 | – | 3.135 | 3.465 | V |
| $V_{IH}$ | High-level input voltage | All digital inputs | – | 2.0 | – | V |
| $V_{IL}$ | Low-level input voltage | All digital inputs | – | – | 0.8 | V |
| $V_{IDIFF}$ | Differential input voltage | RD± {0:23} | – | 150 | – | mV |
| CT | Magnetic center-tap | – | TX | 2.375 | 2.625 | V |
| $V_{ICM}$ | Common mode input voltage | RD±{0:23} | TX | 2.375 | 2.625 | V |
| | | | FX | 1.14 | 2.625 | V |
| $R_{DAC}$ | DAC current-setting resistance | RDAC | – | 1.00 | 1.00 | kΩ (1%) |
| $T_A$ | Ambient operating temperature | – | – | 0 | 70 | °C |

*Table 342:  Recommended Operating Conditions*

| Sym | Parameter | Pins | Mode | Minimum | Maximum | Units |
|-----|-----------|------|------|---------|---------|-------|
| $T_A$ | Ambient operating temperature (Industrial Grade) | – | – | -40 | 85 | °C |
| $T_J$ | Maximum Junction Temperature | – | – | – | 125 | °C |

*Note:* VDDO0, VDDO1, VDDO3 can be set to 2.5V depending the device configuration. See Table 43: "Hardware Signal Definitions," on page 132.

*Note:* For Power-on sequence, it is recommended to power up 1.2V, 2.5V and 3.3V supplies as quickly as possible with a delay separation within 1 to 5 ms. The total ramp-up time should be maintained at less than 10 ms.

# Electrical Characteristics

*Table 343:  Electrical Characteristics*

| Sym | Parameter | Pins | Conditions | Minimum | Typical | Maximum | Units |
|-----|-----------|------|------------|---------|---------|---------|-------|
| $I_{DD1.2}$ | 1.2V supply current | – | 100Base-TX | – | – | 1450 | mA |
| | | | 10Base-T (50 percent utilization) | | | 992 | |
| | | | 10Base-T (100 percent utilization) | | | 977 | |
| $I_{DD2.5}$ | 2.5V supply current | – | 10Base-T/ 100Base-TX | – | – | 193 | mA |
| $I_{DD1.8}$ | Total supply for front end current | Transformer center taps, termination resistors | 100Base-TX | – | – | 1120 | mA |
| | | | 10Base-T (50 percent utilization) | – | – | 960 | |
| | | | 10Base-T (100 percent utilization) | – | – | 1699 | |
| $I_{DD2.5}$ | Total supply for front-end current | Transformer center taps, termination resistors | 100Base-TX | – | – | 1159 | mA |
| | | | 10Base-T (50 percent utilization) | | | 1050 | |
| | | | 10Base-T (100 percent utilization) | | | 1869 | |
| $I_{DD3.3}$ | 3.3V supply current* | – | – | – | – | 100 | mA |
| $V_{OH}$ | High-level output voltage | Digital output | $I_{OH} = -4/8/15$ mA | 2.0 | – | – | V |
| | | TD± {47:24} | Driving loaded magnetics module | – | – | VDD + 1.5 | V |

*Table 343: Electrical Characteristics*

| Sym | Parameter | Pins | Conditions | Minimum | Typical | Maximum | Units |
|-----|-----------|------|------------|---------|---------|---------|-------|
| $V_{OL}$ | Low-level output voltage | Digital output | $I_{OL}$ = 4/8/15 mA | – | – | 0.4 | V |
|  |  | TD± {47:24} | Driving loaded magnetics module | VDD – 1.5 | – | – | V |
| $I_I$ | Input current | Digital inputs with pull-up resistors | $V_I$ = VDDO | – | – | +100 | µA |
|  |  |  | $V_I$ = GND | – | – | −200 | µA |
|  |  | Digital inputs with pull-down resistors | $V_I$ = VDDO | – | – | +200 | µA |
|  |  |  | $V_I$ = GND | – | – | −10 | µA |
|  |  | All other digital inputs | GND ≤ $V_I$ ≤ VDDO | – | – | ±100 | µA |
| $I_{OZ}$ | High-impedance output current | All three-state outputs | GND ≤ $V_O$ ≤ VDDO | – | – | ±10 | µA |
|  |  | All open-drain outputs | $V_O$ = VDDO | – | – | +10 | µA |

\* = Per GMII interface.

| t406R | TXC High to TXEN, TXD, TXER Invalid | 11 ns | – | – |
| t407R | TXC Clock Period | – | 40 ns | – |
| t408R | TXC High/Low Time | 14 ns | – | 26 ns |

# RGMII Interface Timing

## RGMII Output Timing (Normal Mode)

**Figure 48: RGMII Output Timing (Normal Mode)**

*Table 350: RGMII Output Timing (Normal Mode)*

| Description | Parameter | Minimum | Typical | Maximum | Unit |
|---|---|---|---|---|---|
| TXCLK clock period (1000M mode) | – | 7.2 | 8 | 8.8 | ns |
| TXCLK clock period (100M mode) | – | 36 | 40 | 44 | ns |
| TXCLK clock period (10M mode) | – | 360 | 400 | 440 | ns |
| Data valid to clock transition: Available setup time at the output source | t201 | −500 (1000M) | – | +500 (1000M) | ps |
| Clock transition to data valid: Available hold time at the output source | t202 | 3.1 | – | – | ns |

# RGMII Output Timing (Delayed Mode Clock)

**Figure 49:  RGMII Output Timing (Delayed Mode Clock)**

*Table 351:  RGMII Output Timing (Delayed Mode Clock)*

| Description | Parameter | Minimum | Typical | Maximum | Unit |
|---|---|---|---|---|---|
| TXCLK clock period (1000M mode) | – | 7.2 | 8 | 8.8 | ns |
| TXCLK clock period (100M mode) | – | 36 | 40 | 44 | ns |
| TXCLK clock period (10M mode) | – | 360 | 400 | 440 | ns |
| Data valid to clock transition: Available setup time at the output source (delayed mode clock) | t201D | 1.2 (all speeds) | – | – | ns |
| Clock transition to data valid: Available hold time at the output source (delayed mode clock) | t202D | 1.2 | – | – | ns |

# RGMII Input Timing (Normal Mode)

**Figure 50:  RGMII Input Timing (Normal Mode)**

*Table 352:  RGMII Input Timing (Normal Mode)*

| Description | Parameter | Minimum | Typical | Maximum | Unit |
|---|---|---|---|---|---|
| TXCLK clock period (1000M mode) | – | 7.2 | 8 | 8.8 | ns |
| TXCLK clock period (100M mode) | – | 36 | 40 | 44 | ns |
| TXCLK clock period (10M mode) | – | 360 | 400 | 440 | ns |
| Input setup time | t301 | 1.0 (all speeds) | – | – | ns |
| Input hold time | t302 | 1.0 (all speeds) | – | – | ns |
| Required data window at the input | t301+t302 | 2.0 | – | – | ns |

# RGMII Input Timing (Delayed Mode Clock)

**Figure 51:  RGMII Input Timing (Delayed Mode Clock)**

*Table 353:  RGMII Input Timing (Delayed Mode Clock)*

| Description | Parameter | Minimum | Typical | Maximum | Unit |
|---|---|---|---|---|---|
| TXCLK clock period (1000M mode) | – | 7.2 | 8 | 8.8 | ns |
| TXCLK clock period (100M mode) | – | 36 | 40 | 44 | ns |
| TXCLK clock period (10M mode) | – | 360 | 400 | 440 | ns |
| Input setup time (delayed mode clock) | t301D | –1.0 (1000M) | – | – | ns |
| | | –5.0 (10/100M) | – | – | ns |
| Input hold time (delayed mode clock) | t302D | 3.0 (1000M) | – | – | ns |
| | | 7.0 (10/100M) | – | – | ns |
| Required data window at the input | t301D+t302D | 2.0 | – | – | ns |

# GMII Interface Timing

## GMII Interface Output Timing

**Figure 52: GMII Output Timing**

*Table 354: GMII Output Timing*

| Description | Parameter | Minimum | Typical | Maximum | Unit |
|---|---|---|---|---|---|
| GMII(0:1)_GXTCLK clock period (1000M mode) | – | – | 8 | – | ns |
| GMII(0:1)_GXTCLK clock period (100M mode) | – | – | 40 | – | ns |
| GMII(0:1)_GXTCLK clock period (10M mode) | – | – | 400 | – | ns |
| Output delay from GMII(0:1)_GXTCLK rising | t502 | 0.5 | – | 5.5 | ns |

# GMII Interface Input Timing

| Input hold time | t515 | 1.5 | – | – | ns |

# SPI Timing

**Figure 56:  SPI Timing, $\overline{SS}$ Asserted During SCK High**

**Figure 57:  SPI Timing, $\overline{SS}$ Asserted During SCK Low**

*Table 358:  SPI Timing*

| Parameter | Description | Minimum | Typical | Maximum |
|---|---|---|---|---|
| t601 | SCK Clock Period | – | 500 ns | – |
| t602 | SCK High/Low Time | 200 ns | – | 300 ns |
| t603a, t603b | MOSI to SCK Setup Time | 5 ns | – | – |
| t604a, t604b | MOSI to SCK Hold Time | 12 ns | – | – |
| t605a, t605b | SCK to MISO Valid | – | – | 25 ns |
| t606a, t606b | SCK to MISO Invalid | 0 ns | – | – |

**Note:** The BCM53242M behaves only as a slave device. The $\overline{SS}$ is asynchronous. If $\overline{SS}$ is asserted during SCK high then BCM53242M samples data on the rising edge of SCK and references the falling edge to output data. Otherwise BCM53242M samples data on the falling edge and outputs data on the rising edge of SCK.

# EEPROM Timing

**Figure 58:  EEPROM Timing**
*Table 359:  EEPROM Timing*

| Parameter | Description | Minimum | Typical | Maximum |
|---|---|---|---|---|
| t701 | CK Clock Frequency | – | 100 KHz | – |
| t702 | CK High/Low Time | – | 5 us | – |
| t703 | CK low to CS, DI Valid | – | – | 500 ns |
| t704 | CK low to CS, DI Invalid | 500 ns | – | – |
| t705 | DO to CK falling Setup Time | 200 ns | – | – |
| t706 | DO to CK falling Hold Time | 200 ns | – | – |

# Management Data Interface

**Figure 59:  Management Data Interface**

*Table 360:  Management Data Interface (Slave Mode)*

| Parameter | Description | Minimum | Typical | Maximum |
|-----------|-------------|---------|---------|---------|
| t801 | MDC Clock Period | – | 80 ns | – |
| t802 | MDC High/Low Time | 30 ns | – | 50 ns |
| t803 | MDIO to MDC rising Setup Time | 5 ns | – | – |
| t804 | MDIO to MDC rising Hold Time | 5 ns | – | – |
| t805 | MDC rising to MDIO Valid | – | – | 50 ns |
| t806 | MDC rising to MDIO Invalid | 10 ns | – | – |

*Table 361:  Management Data Interface (Master Mode)*

| Parameter | Description | Minimum | Typical | Maximum |
|-----------|-------------|---------|---------|---------|
| t801 | MDC Clock Period | – | 400 ns | – |
| t802 | MDC High/Low Time | 150 ns | – | 250 ns |
| t803 | MDIO to MDC rising Setup Time | 10 ns | – | – |
| t804 | MDIO to MDC rising Hold Time | 10 ns | – | – |
| t805 | MDC rising to MDIO Valid | – | – | 100 ns |
| t806 | MDC rising to MDIO Invalid | 10 ns | – | – |

# Section 11: Thermal Characteristics

*Table 362: 400-PBGA Thermal Characteristics with External Heat Sink at 70°C*

| Air Flow (LFPM) | 0 | 100 | 200 | 400 | 600 |
|---|---|---|---|---|---|
| Theta-$_{JA}$ (°C/W) | 10.43 | 8.20 | 7.42 | 6.80 | 6.58 |
| Theta-$_{JB}$ (°C/W) | 5.26 | – | – | – | – |
| Theta-$_{JC}$ (°C/W) | 4.50 | – | – | – | – |
| Maximum Junction Temperature T$_J$ | 127.38°C | 115.12 | 110.82 | 107.41 | 106.19 |
| Heatsink: TwinPeaks Electronics Aluminum blade-fin, 35 mm x 35 mm x 20 mm, k = 180 W/m.K. | | | | | |

*Table 363: 400-PBGA Thermal Characteristics with External Heat Sink at 85°C*

| Air Flow (LFPM) | 0 | 100 | 200 | 400 | 600 |
|---|---|---|---|---|---|
| Theta-$_{JA}$ (°C/W) | 10.43 | 8.20 | 7.42 | 6.80 | 6.58 |
| Theta-$_{JB}$ (°C/W) | 5.26 | – | – | – | – |
| Theta-$_{JC}$ (°C/W) | 4.50 | – | – | – | – |
| Maximum Junction Temperature T$_J$ | 142.38 | 130.12 | 125.82 | 122.41 | 121.19 |
| Heatsink: TwinPeaks Electronics Aluminum blade-fin, 35 mm x 35 mm x 20 mm, k = 180 W/m.K. | | | | | |

# Section 12: Mechanical Information

**Figure 60:  400-PBGA Package Outline Drawing**

# Section 13: Ordering Information

*Table 364:  Ordering Information*

| Part Number | Package | Ambient Temperature |
|---|---|---|
| BCM53242MKPB(G) | 400 PBGA | Commercial grade 0°C to 70°C |
| BCM53242MIPB(G) | 400 PBGA | Industrial grade –40°C to 85°C |

*Note:* The letter *G* denotes the lead-free option.
